
8. Four theories in search of an A(I)uthor

Giancarlo Frosio

1. INTRODUCTION

In 1843, Augusta Ada King, Countess of Lovelace, argued: “[s]upposing, for instance, that the fundamental relations of pitched sounds in the science of harmony and of musical composition were susceptible of such expression and adaptations, the engine might compose elaborate and scientific pieces of music of any degree of complexity or extent.”¹ Ada Lovelace, the first programmer in history, saw far into the future of the computer—or the “analytical engine,” as Babbage termed it at the time—that she had contributed to the invention of. Today, intelligent machines come in multiple shapes to serve diverse purposes and could possibly replace humans everywhere, including the once inherently human-centered field of creativity.² AI not only composes music, as Lovelace predicted, but also writes poems, novels, and news articles; edits photographs; creates video games; and makes paintings and other artworks.³ The A(I)uthor is already among us. In this context, the adaption of the intellectual property (IP) system to AI-generated creativity and innovation is increasingly becoming a topic of critical interest.⁴

¹ Ada Augusta, Countess of Lovelace, notes on L.F. Menabrea, “Sketch of the Analytical Engine Invented by Charles Babbage” (September 1843) Scientific Memoirs www.fourmilab.ch/babbage/sketch.html.

² See Arthur Miller, *The Artist in the Machine: The World of AI-Powered Creativity* (MIT Press 2019) (stating that computer creativity will surpass human creativity). See eg Baptiste Caramiaux, Fabien Lotte and Joost Geurts (ed), “AI in media and creative industries” (version 1, New European Media 1 April 2019) <https://arxiv.org/ftp/arxiv/papers/1905/1905.04175.pdf>; Andreas Pfeiffer, “Creativity and technology in the in age of AI” (Pfeiffer Report 2018) 15, 29 <https://www.pfeifferreport.com/wp-content/uploads/2018/10/Creativity-and-technology-in-the-age-of-AI.pdf>; European Audiovisual Observatory (2019), “Artificial Intelligence: Summary of Observatory workshop on AI in the audiovisual industry” (EAO, 17 December 2019) <https://rm.coe.int/summary-workshop-2019-bat-2/16809c992a>.

³ For example, a novella written by a machine has made the first rounds of a literary competition in Japan, beating in the process thousands of human authors. See Danny Lewis, “An AI-Written Novella Almost Won a Literary Prize” (*Smithsonian Magazine*, March 28, 2016) www.smithsonianmag.com/smart-news/ai-written-novella-almost-won-literary-prize-180958577. *Sunspring*, a sci-fi film written entirely by an AI, placed top ten in Sci-Fi London’s annual film festival. See Carys Craig and Ian Kerr, “The Death of the AI Author” (2019) Osgoode Legal Studies Research Paper, 1–2. AIVA—like Amper or Melodrive—runs an AI that composes music, which is marketed to accompany audiovisual works, advertisements or video games. Meanwhile, Sony’s Flow Machine can interact and co-improvise with a human music performer. See Sony Flow Machines www.flow-machines.com. Again, the AI-generated *Portrait of Edmond de Bellamy* sold at Christie’s for an astounding \$432,500. See Craig and Kerr 3–4.

⁴ See Maria Iglesias Portela, Sharon Shamuilia, and Amanda Anderberg, “Intellectual Property and Artificial Intelligence: A Literature Review” (Joint Research Centre, Publications Office of the European Union 2019). See also Jeremy Cubert and Richard Bone, “The Law of Intellectual Property Created by Artificial Intelligence” in Woodrow Barfield and Ugo Pagallo (eds), *Research Handbook on the Law of Artificial Intelligence* (Edward Elgar Publishing 2018) 411–27.

Of course, existing IP regimes, including copyright law, trade secrets, and patent law,⁵ can protect software on which AI technology is based.⁶ However, the protection afforded to the software does not extend to the output possibly generated by the AI. In this context, a report from the European Commission highlights that “protection of AI generated works [...] seems to be [...] problematic” as, “[i]n light of the humanist approach of copyright law, it is questionable that AI-generated works deserve copyright protection.”⁷ Therefore, the report continues, “while some copyright scholars clearly advocate for AI-generated works to be placed in the public domain, others have put forward a series of proposals aimed at ensuring a certain level of protection”; however, “[w]ith notable exceptions, these proposals [...] do not always sufficiently detail the possible elements underpinning such protection.”⁸

In searching for a justification to protect AI-generated creativity, this chapter would like to answer a set of emerging legal questions. How does AI-generated creativity fit within traditional copyright theory and existing legal requirements for copyright protection? Is AI legal personhood available under the present legal framework? Should it be considered in as an option for legal reform? Is AI an author under traditional copyright standards? Does a machine meet the copyright standard for originality? And, again, from a more general techno-legal perspective, is it perhaps oxymoronic to refer to AI-generated creative works? After answering what can be summarized as the question of the A(I)uthor,⁹ this chapter will end by considering the road ahead: reviewing policy options and looking for their justification from different theoretical perspectives, such as fairness, personality, utilitarian/incentive, and cultural theories of intellectual property.

⁵ Whether protecting software as a computer-implemented invention or as such, depending on the jurisdiction.

⁸ Ibid 68.

⁹ Besides the question of the A(I)uthor, there are two other fundamental questions that are beyond the scope of this chapter: the questions of the (Machine) Learner and the (A)Infringer. They refer to whether an AI can infringe copyright through the machine-learning process and training that enables the AI to generate creativity and whether an AI can infringe copyright by creating an infringing output. The question of the (Machine) Learner has been studied by abundant literature. In particular, this author, and his co-authors, have reviewed the matter extensively. See eg Christophe Geiger, Giancarlo Frosio, and Oleksander Bulayenko, “Text and Data Mining: Art. 3 and 4 of the Directive 790/2019/EU” in Concepción Sáiz García and Raquel Evangelio Llorca (eds), *Los Derechos de autor en el mercado unico digital Europeo* (Tirant lo Blanch 2019); Christophe Geiger, Giancarlo Frosio, and Oleksander Bulayenko, “Text and Data Mining in the Proposed Copyright Reform: Making the EU Ready for an Age of Big Data?” (2018) 49(7) IIC 814–44. An essential bibliography including literature treating this question can be found at Giancarlo Frosio, “L’(I)Autore inesistente: una tesi tecno-giuridica contro la tutela dell’opera generata dall’intelligenza artificiale” 29 AIDA 52–91, 54, fn 13 (2020). Very recently, see also Mark Lemley and Bryan Casey, “Fair Learning” (2021) 99 Texas L Rev 743, 743–85.

2. IN SEARCH OF THEORETICAL JUSTIFICATIONS OF IP FOR AI

The theoretical framework justifying copyright differs substantially among jurisdictions. It is important to outline these differences from the very beginning, as both the policy options available and those potentially applicable as a result of legal reform will depend on the theoretical perspective from which the question of the A(I)uthor is observed.¹⁰

Four IP theoretical clusters have emerged throughout the history of copyright law: fairness theory, personality theory, welfare theory, and, more recently, cultural theory.¹¹ Fairness and personality theory have traditionally been the theoretical pillars of European copyright law. Both fairness and personality theory are natural right theories that emphasize individual exclusive rights. Fairness theory does so on the basis of the Lockean natural law property theory. According to Locke, each person has a natural right to the fruits of his or her labor upon land held in common.¹² Later, William Blackstone applied the same principles to intellectual labor as well.¹³ Personality theories, instead, characterize the civil law tradition and are rooted in German idealism. Intellectual products are manifestations or extensions of the personalities of their creators, who enjoy an unrestrained natural right over them.¹⁴

In contrast, welfare and cultural theories are collectivistic and prospective. Welfare theory, based on Bentham and Mill's utilitarianism and economic analysis of law, looks at maximization of social welfare.¹⁵ In particular, welfare theory portends that rights should be crafted to provide the "greatest happiness of the greatest number."¹⁶ It is also known as "incentive theory," as the law should create a system of incentives which will induce creators to create.¹⁷ In this respect, this approach looks at creativity dynamically, not only rewarding labor or personal entitlements for today's creativity but setting the foundations for tomorrow's creative ecosystem. Cultural theory also looks at the well-being of society at large, but with

¹⁷ See Fisher (n 11) 177–80.

a more marked prospective emphasis, by focusing on promoting a just and attractive culture.¹⁸ Although the result of multiple interdisciplinary contributions, this theoretical approach might find its foundation in Thomas Aquinas' ideas that identified law's primary function in the "common good of humanity."¹⁹ In particular, for Aquinas, the role of society is to define a framework for human happiness according to universal human values, including education, culture, environment, health. Therefore, for Aquinas, the good of mankind is one that maximizes happiness. From this perspective, cultural theory would like to overcome the utilitarian paradigm that measures aggregated consumer welfare according to what consumers want, by instead identifying conditions which will support widespread human flourishing. As Fisher puts it, "[t]his approach is similar to utilitarianism in its teleological orientation, but dissimilar in its willingness to deploy visions of a desirable society richer than the conceptions of 'social welfare' deployed by utilitarians."²⁰ Cultural theory approaches would like to readjust the intellectual property policy framework by promoting enhanced "distributive justice" beyond the traditional market-based approach of welfare and utilitarian theories.²¹

3. ASSESSING PROTECTABILITY OF AI-GENERATED CREATIVITY UNDER THE PRESENT COPYRIGHT LEGAL FRAMEWORK

This chapter shall now consider whether AI-generated creativity can be protected under the current copyright regime. This investigation will look into three major conditions for copyright protection of creative works: (1) legal personality; (2) authorship; and (3) originality.

3.1 Legal Personality

Perhaps surprisingly, some theoretical thinking supports the idea of legal personality of intelligent machines. Nick Bostrom, for example, notes: "machines capable of independent initiative and of making their own plans [...] are perhaps more appropriately viewed as persons than machines."²² Authors have highlighted how there are no legal reasons or conceptual motives for denying the personhood of AI robots as the law should grant personality on the grounds of rational choices and empirical evidence, rather than prejudice.²³ Therefore, arguments have been made in favour of granting personhood to future hypothetical strong AI that are autono-

mous, intelligent, and conscious.²⁴ Even more surprisingly—but in line with the conclusions of the literature just mentioned—the European Parliament (EP) is considering the possibility of declaring AI and robots “electronic persons.” In a Resolution on *Civil Law Rules on Robotics*, the European Parliament wondered whether ordinary liability rules are sufficient or whether AI calls for new rules.²⁵ The Resolution claims that “the more autonomous robots are, the less they can be considered simple tools in the hands of other actors (such as the manufacturer, the owner, the user, etc.).”²⁶ The EP endorses the view that EU legislation cannot fully address non-contractual liability for damages caused by autonomous AI. Traditional rules would still apply if the cause of the robot’s act or omission can be traced back to a specific human agent such as the manufacturer, the operator, the owner, or the user, such as in the case the robot has malfunctioned or where the human agent could have foreseen and avoided the robot’s harmful behaviour. But what if the cause of the robot’s act or omission cannot be traced back to a specific human agent? What if there are no manufacturing defects and the AI has not malfunctioned but acted autonomously in causing damages for which no causal link with the manufacturer can be proved? In this scenario, Directive 85/374/EEC on Product Liability should not apply. Therefore, the Resolution highlights that this makes the ordinary rules on liability insufficient and calls for new rules to clarify whether a machine can be held responsible for its acts or omissions.²⁷ Although the Resolution recognizes that “at least at the present stage the responsibility must lie with a human and not a robot,” in the long run the Resolution calls for (1) an obligatory insurance scheme which takes into account all potential responsibilities in the chain²⁸ and (2) the creation of a specific legal status for robots, “so that at least the most sophisticated autonomous robots could be established as having the status of electronic persons responsible for making good any damage they may cause.”²⁹

However, whether quasi-human or hyper-human AI is coming, legal personality of machines is certainly unavailable under the present legal framework. Scholarship has consistently stressed how any hypothesis about granting AI robots full legal personhood must be discarded until fundamental technological changes have occurred.³⁰ Pagallo highlights, among the normative arguments against legal personhood, the “missing something problem,” accord-

²⁴ Meaning respectively that the AI should be capable of taking a decision without input action, of self-programming and integrating information in a framework, and of subjective experience. ing to which current AI robots lack most requisites that usually are associated with granting someone, or something, legal personhood: such artificial agents are not self-conscious and do not possess human-like intentions or properly suffer.³¹ Statistical analysis of different conditions for legal personhood set up by US case law, for example, would also show incompatibility between legal personhood and AI entities.³² This empirical analysis proves that to grant personhood, courts look at whether it is granted directly or indirectly by a statute, if the artificial entity can sue and be sued, and finally if the entity is an aggregate of natural persons.³³

Caution against construing AI as a legal person emerges also from the European Parliament's 2017 Resolution, which finally excluded any form of AI legal personality, at least in the short and mid-term. In addition, the EU Parliament seems now to reject AI's legal personality in specific connection to AI-generated creativity. In a recent *Draft Report on intellectual property rights for the development of artificial intelligence technologies*, the European Parliament noted, as part of a motion for a Parliament Resolution, that "the autonomisation of the creative process raises issues relating to the ownership of IPRs [but the Parliament] considers, in this connection, that it would not be appropriate to seek to impart legal personality to AI technologies."³⁴ Rather than establishing legal personality of machines, the policy challenge would be to properly allocate accountability and liability for the activities of AI robots in cases of complex distributed responsibility, for example through contracts and business law.³⁵

3.2 Authorship

The question of AI-generated creativity's copyright protectability requires consideration of whether an AI is an author according to traditional copyright standards. Put bluntly, is a human author an intrinsic requirement for authorship? Although international treaties do not include a definition of "author" that can provide a definitive answer, some textual references to human creation in the Berne Convention might exclude AI from the scope of the notion of author. First, the term of protection linked to the life of the author would be hard to reconcile with machines as authors.³⁶ Again, reference to the nationality—or residence—of the author seems also to imply that the notion of authorship only applies to human agents.³⁷ Overall, it has been argued that "Berne's humanist cast" and its deference to personality theories strongly support a "human-centered notion of authorship presently enshrined in the Berne Convention" that would exclude non-human authorship from Berne's scope.³⁸

See also Tanya Aplin and Giulia Pasqualetto, "Artificial Intelligence and Copyright

A close review of EU law would most likely lead to similar conclusions.³⁹ Although there is no transversal definition in statutory law of the notion of authorship, an author is defined as a natural person, a group of persons or a legal person both by Art. 2(1) of the Software Directive⁴⁰ and by Art. 4(1) of the Database Directive.⁴¹ Actually, the *travaux préparatoires* of the Software and Database Directive fully endorsed an anthropocentric vision of authorship by referring specifically to “the human author who creates the work” and “the natural person [that] will retain at least the unalienable rights to claim paternity of his work.”⁴² Again, the original proposal for a Software Directive concluded: “[t]he human input as regards the creation of machine generated programs may be relatively modest, and will be increasingly modest in the future. Nevertheless, a human ‘author’ in the widest sense is always present, and must have the right to claim ‘authorship’ of the program.”⁴³ In the CJEU *Painer* case, Advocate General Trstenjak stressed the same point by noting that “only human creations are therefore protected, which can also include those for which the person employs a technical aid, such as a camera.”⁴⁴ EU national legislation confirms this approach. For example, Art. L111-1 of the French Intellectual Property Code⁴⁵ requires copyrightable work to be the “creation of the mind”; Art. 5 of the Spanish Copyright Act plainly states that “the author of a work is the natural person who creates it”;⁴⁶ and Art. 11 of the German Copyright Act attaches authorship to a personality approach by protecting “the author in his intellectual and personal relationships to the work.”⁴⁷ In addition, EU law—as well as a large amount of national legis-

lation⁴⁸—endorses a human-centric approach when providing a presumption of authorship for the *person* whose name is indicated in the work, in absence of proof to the contrary.⁴⁹

The US legal system would also leave little room for mechanical authors. The US Copyright Act does not have an express statutory definition of authorship, so that some commentators have argued that, textually, the Statute does not limit authorship to human authors.⁵⁰ However, both additional textual references and case law apparently exclude the possibility of construing non-human agents as authors under the statute. In particular, Section 101 of the Copyright Act defines anonymous works as “ones where no natural person is identified as an author,”⁵¹ thus pointing at natural persons as potential authors. Also, there is a long-lasting understanding that the constitutional history of the word “copyright” would dispose in favor of only humans as “authors.”⁵² US courts have consistently supported this understanding. The Supreme Court has plainly stated that “[a]s a general rule, the author is [...] the *person* who translates an idea into a fixed, tangible expression entitled to copyright protection.”⁵³ In *Feist v Rural*, the US Supreme Court discusses at length the notion of authorship and author by reviewing the notion of originality, which would refer to inherently human features, such as “creative spark” or “intellectual production, of thought, and conception.”⁵⁴ Earlier cases would support the same conclusion. The *Trade-Mark Cases* state that the copyright law only protects “the fruits of intellectual labor” that “are founded in the creative powers of the mind.”⁵⁵ In *Burrow-Giles*, then, the US Supreme Court reminded that copyright law is limited to “original intellectual conceptions of the author.”⁵⁶

A recent case, finally, has perhaps put the matter to rest in the United States. In *Naruto v Slater*, two selfies were taken by the seven-year-old crested macaque Naruto when wildlife photographer David Slater left his camera unattended on one of his visits to Indonesia. Later, in 2014, the “Monkey Selfies” were published in a book through Blurb Inc. which identified Slater and Wildlife Personalities Ltd as the copyright owners. In 2015, People for the Ethical

Treatment of Animals (PETA) filed a complaint of copyright infringement as next friends and on behalf of *Naruto* against Slater, Wildlife Personalities Ltd, and Blurb Inc. before the District Court of California. In this context, the court had the opportunity to consider whether *Naruto* could be vested with a copyright in its selfie. The District Court granted the motion to dismiss filed by the Defendants on the basis that *Naruto* failed to establish statutory standing under the Copyright Act and noted: “[i]f the humans purporting to act on Plaintiff’s behalf wish for copyright to be among the areas of law where nonhuman animals have standing, they should make that dubious case to Congress—not the federal courts.”⁵⁷ The decision was appealed and while the parties agreed to a settlement, the Court of Appeals declined to dismiss the appeal and affirmed the lower court’s decision. The majority found that while animals have Article III standing to sue, animals do not have statutory standing under the Copyright Act.⁵⁸ The court relied on the Ninth Circuit decision in *Cetacean Community v Bush*, where it was held that animals have statutory standing only if the statute plainly states so.⁵⁹ Moreover, the terms “children,” “grandchildren,” “legitimate,” “widow,” and “widower” used in the Statute necessarily imply that the Copyright Act excludes animals that “do not marry and do not have heirs entitled to property by law.”⁶⁰ Of course, the findings in the *Naruto* decision can easily be extended to any non-human and AI-generated creativity. In this regard, the Third Edition of the Compendium of U.S. Copyright Office Practices, which was published in December 2014, after the *Naruto* case started, provided non-binding guidance that excluded non-human authorship.⁶¹ The compendium repeatedly refers to persons or human beings when discussing authorship. More specifically, under Section 306, the “Human Authorship Requirement” limits registration to “original intellectual conceptions of the author” created by a human being. As clarified under Section 313.2, “Works that Lack Human Authorship,” works produced by nature, animals, or plants, and similarly works created by a machine or by a mechanical process without intervention from a human author, are not copyrightable. Referring to the *Trade-Mark Cases* and *Burrow-Giles*, the Copyright Office concluded that it would refuse to register a claim if it determined that a human being did not create the work.⁶²

In China, AI authorship has been discussed by multiple courts. In *Beijing Feilin Law Firm v Baidu Corporation*, the Court denied copyright protection to works created solely by machines and confirmed that copyright protection requires human authorship.⁶³ The case dealt with a report published by a Beijing-based law firm on its official WeChat account. After an unidentifiable internet user published the report online without permission, the law firm brought an infringement suit before the Beijing Internet Court. The report was generated using

⁶³ *Beijing Feilin Law Firm v Baidu Corporation* (26 April 2019) Beijing Internet Court, (2018) Beijing 0491 Minchu No. 239; Kan He, “Feilin v. Baidu: Beijing Internet Court Tackles Protection of AI/Software-generated Work and Holds that Copyright Only Vests in Works by Human Authors” (*The IPKat*, 9 November 2019) <http://ipkitten.blogspot.com/2019/11/feilin-v-baidu-beijing-internet-court.html>; Ming Chen, “Beijing Internet Court Denies Copyright to Works Created Solely by Artificial Intelligence” (2019) 14(8) *JIPLP* 593.

Wolters Kluwer China Law & Reference, which is legal information query software. While the Plaintiff argued that the tool was used only for assistance, the Defendants claimed that the entire report was generated by the software. During the proceedings, an automated report generated by the software on key words set by the Plaintiff's attorney was compared to the disputed report. The two reports were found substantially dissimilar. While the disputed report was eligible for protection under Chinese copyright law due to the original human contributions that it included, the court also considered the protectability of the report automatically generated by the software. In discussing protection of works exclusively generated by an AI, the Court held that the notion of authorship requires the work to be created by a natural person. However, the Court believed that some sort of protection should be given to the user⁶⁴ of the software that generates creative works in order to incentivize purchases of that software as well as generation and distribution of the works, although the judgment does not provide clarifications or suggestions in this regard.

In a later decision, *Shenzhen Tencent v Yinxun*, the Nanshan District Court in Shenzhen *de facto* confirmed the Beijing ruling by granting protection to the original contributions from human agents, rather than exclusively AI-generated creativity.⁶⁵ Tencent Technology developed an AI writing assistant, *Dreamwriter*. In August 2018 Tencent published one of *Dreamwriter*'s works on its website, informing the reader that the article was written by Tencent's AI. Shortly thereafter, the Defendant allegedly published the article online without Tencent's consent. Bringing a lawsuit for infringement, Tencent argued that the article was generated under its supervision and Tencent was responsible for the organization and creation of the article as well as any liability arising thereof. The Court ruled in favour of Tencent by noting that the article met the requirements of being an original literary work as the content was a product of the input data, trigger conditions, and arrangement of templates and resources selected by Tencent's operational group. Since the expression of the article came from individual choices and arrangement made by Tencent's team, the (AI-generated) article was considered a work for hire under Article 11 of the Chinese Copyright Law and the defendant was held liable for infringement. Although the court might have viewed the work as an integrated intellectual creation, deriving both from the contribution by the human team and the operation of "Dreamwriter," the protection granted apparently stems from the human team's contribution rather than any AI contribution.

4. ORIGINALITY

Even if a textual anthropocentric construction of authorship is disregarded, originality as a condition for copyright protection seems to prevent protection of AI-generated creativity. Textual references and case law construe originality via an anthropocentric model that emphasizes self-consciousness. Originality is widely defined in most jurisdictions in light of a so-called

⁶⁴ Rather than the software developer, who is already rewarded by a copyright over the software. *Ibid.*

⁶⁵ See *Shenzhen Tencent v Yinxun*, Nanshan District People's Court of Shenzhen, Guangdong Province [2019] No. 14010 (China) <https://mp.weixin.qq.com/s/jjv7aYT5wDBIdTVWXXV6rdQ>. See also Kan He, "Another Decision on AI-generated Works in China: Is It a Work of Legal Entities?" (*The IPKat*, 29 January 2020).

personality approach that describes an original work as a representation of the personality of the author.⁶⁶ This construction of originality has sidelined earlier approaches endorsing “sweat of the brow” doctrines that rewarded “skills, labor and efforts” in creating intellectual work regardless of whether the work was representative of the personality of the author.⁶⁷ Therefore, originality as a representation of “self” and self-consciousness would be, in theory, beyond the reach of machine-generated creativity.⁶⁸

In the European Union, three Directives have vertically harmonized the notion of originality. According to the Software, Term, and Database Directive a work is original if it is “the author’s own intellectual creation.”⁶⁹ Later, the CJEU “horizontally” expanded this harmonized notion of originality to all copyright subject matters. In *Infopaq*, the CJEU noted that “[i]t is only through the choice, sequence and combination of those words that the author may express his creativity in an original manner and achieve a result that is an intellectual creation.”⁷⁰ The *Eva-Maria Painer* decision further explained that a work is original and can be protected if it: (1) is an intellectual creation of the author; (2) reflects his personality; and (3) expresses his free and creative choices in the production of that photograph.⁷¹ By making those various choices, the author of a portrait photograph can stamp the work created with his “personal touch.”⁷² In *Football Dataco*, finally, the CJEU rejected any remaining “sweat of the brow” doctrines and noted that significant labor and skill of the author cannot as such justify copyright protection if they do not express any originality.⁷³

The personality approach to originality has become the dominant standard in the United States as well. Dating back to early cases such as *Burrow-Giles v Sarony*, the US Supreme Court has concluded that originality derives from the free creative choices of the author that imbues the work with his personality⁷⁴ “such as the final product duplicates his conceptions and visions” of what the work should be.⁷⁵ In particular, *Burrow-Giles* held photographs copyrightable because they could be traced from the photographer’s “own original mental conception.”⁷⁶ Later, in *Feist v Rural*, the US Supreme Court clearly states that only works with a minimum of creativity that represents the personality of the author can be original;

⁶⁶ This characterization of originality builds upon Idealist personality theories, according to which intellectual products are manifestations or extensions of the personalities of their creators. See n 14.

labor and efforts in creating a work would not alone qualify for copyright protection.⁷⁷ In light of these principles, output such as computational shorthand⁷⁸ or listing of automatically numbered hardware parts created using software systems have been found to lack the originality for protection under copyright.⁷⁹ The United States joining the Berne Convention in 1988 and the *Feist* case in 1991 saw the crystallization of a globally more harmonized view of copyright, which would include a construction of originality in personality theory terms.⁸⁰ A few authors have argued that there are no statutory limitations in the US on treating machines as authors as “[t]he copyright standard of originality is sufficiently low that computer-generated works, even if found to be created solely by a machine, might seem able to qualify for protection.”⁸¹ I would note that, after *Feist*, originality is not only a question of quantum. For AI-generated creativity purposes, it is irrelevant whether the standard of originality is low or high. The standard the AI fails to reach is qualitative rather than quantitative. AI cannot express “self.” The creativity that it generates cannot express the personality of the author because AI has none.

More recently, a few remaining—mainly common law—jurisdictions have been also endorsing a personality approach to originality. This has been the case in Australia,⁸² India,⁸³ and the United Kingdom,⁸⁴ which have finally rejected previous “labor, skill and efforts” approaches. Only a few countries still follow “sweat of the brow” doctrines and reject personality approaches to originality, including South Africa⁸⁵ and New Zealand.⁸⁶ In sum, the notion of originality seems to be consistently construed via an anthropocentric vision positing that a work is original if it is a representation of “self,” a representation of the personality of the author. Of course, only a sentient self-conscious being would be capable of representing “self” through a work. In turn, absent the creator’s self-consciousness, the originality requirement that lies in the representation of the personality of the author cannot be met. Therefore, unless machines achieve self-consciousness—which might be the case with futuristic hypothetical strong AI—AI-generated creativity cannot meet the originality requirement under the present legal framework.⁸⁷

5. POLICY OPTIONS

As our earlier review of requirements for protection has suggested, the construction of the notion of legal personality, authorship, and originality under the present copyright regime might exclude AI-generated creativity from copyright protection.⁸⁸ However, scholars and courts have been wondering whether not granting protection to AI-generated creativity would be a suboptimal solution, in particular from an “incentive theory” perspective.

In fact, future policy directions depend heavily on the application of alternative—and competing—IP theoretical approaches. Incentive theory or utilitarianism,⁸⁹ which is dominant in the United States and common law jurisdictions, is less concerned with the humanity of the author than are personality theories, which have a greater influence in civil law jurisdictions.⁹⁰ This provides more room for arguments in favour of nonhuman authorship and protectability of AI-generated creativity. According to the incentive theory approach, “providing financial incentives in order to encourage the growth and development of the AI industry and ensure the dissemination of AI generated works is arguably the ultimate goal of assigning copyright to human authors.”⁹¹ Although a computer does not need an incentive to produce its output, the incentive may be useful for the person collaborating with the computer.⁹² In particular, authors argue that there should be some additional incentive to encourage industry to invest the time and money that it will take to teach machines to behave intelligently⁹³ or to reward users training and instructing AI-generating content.⁹⁴ In contrast, most civil law jurisdictions might be less responsive to welfare and incentive arguments and prefer to value systemic balance, thus rejecting any departure from the personality theory approach that shapes the civil law copyright perspective—and its notion of originality. In addition, although AI-generated creations may justify incentives to bolster innovation and commercialization, the necessity of such incentives is questionable considering the impact it can have on human creations.⁹⁵ For example, considering the vast number of automated creations, granting protection for these

works could devalue human authorship and existing jobs in the field,⁹⁶ hamper creativity, as it could discourage artists from publishing their creations due to the fear of infringing protected material,⁹⁷ or clog the creative ecosystem with standardized and homogenized AI-generated outputs, impacting cultural diversity and identity politics.

Put it bluntly, the policy question to be determined is whether expansion of current copyright protection to computer-generated works is useful. The current legal framework might already provide enough protection through patent and copyright law to the underlying software, through *sui generis* protection to databases, or through other legal mechanisms, such as competition law, to protect automated works without extending the existing copyright regime to non-human authors.⁹⁸ As suggested, the questions should be investigated from a law and economics perspective before favoring any solutions.⁹⁹ The next few pages will present the major policy options under consideration.

5.1 Option 1: The Public Domain Status of AI-generated Works

Granting public domain status to AI-generated creativity is the first available policy option, and most likely to be the solution endorsed by the present legal framework. Under this perspective, any attempt at construing AI as an author would be an illusion resulting from a process of anthropomorphization of the machine, which in fact does not know anything of the actions and role that this misperception would ascribe to it. Anything predicated as free creative choices of the machine—supposedly acting autonomously from the initial instructions provided by developers and users—would in fact be mere chance/randomness programmed into computational processes. Dan Burk powerfully sums up this perspective:

For any given AI system, a human designed and wrote the program the constitutes the machine learning algorithm. One or more humans selected the training data for the algorithm. One or more humans determined the statistical parameters for the program, modulating overfitting or underfitting of the data. Numerous human choices were made in generating the resulting output. If there is an author, it is one of more of the humans who are sufficiently causally proximate to the production of the output. In some instances there may be joint authors. In some instances, none of them may be sufficiently causally proximate to claim authorship, and there will be no author, as in the case of an errant wind or feral hogs. But the author is never the machine.¹⁰⁰

According to this policy option, copyright ownership depends only on the amount of human intervention. Mere data selection and classification by humans is insufficient to meet the

“originality” requirement; instead, actual and substantial human contribution to guide the AI system in creation is necessary for grant of protection.¹⁰¹ Only when there is substantial human input, and all creative choices are embedded in the computer code or users’ instructions, will copyright vest with the human author.¹⁰² In this regard, four models of allocating authorship have been identified: (1) sole authorship to users of the tool—if the designer of the tool does not contribute the creative work generated; (2) sole authorship to developers of the tool—if the user plays no role in the output and the self-generative tool creates output based on the training and creative raw material provided by the developer; (3) joint authorship to user and developer—when the outputs reflect the creative contributions of both developer and user; (4) authorless works—neither designer nor user contribute sufficient expression to form an original work of authorship.¹⁰³ In any event, if the creative output results both from human and machine choices, materials resulting from machine-made choices must be filtered out, as is customarily done with public domain materials.¹⁰⁴ Only independently copyrightable human contributions will be protectable.

5.2 Option 2: Copyright Protection of AI-Generated Work

In order to avoid AI-generated creativity falling within the public domain and grant necessary incentives to human agents involved with the AI creative process, proposals to grant copyright protection to AI-generated works have been made. Alternatively, copyright ownership would vest directly in the machine that generates the works or human agents potentially involved with the creative process.

5.2.1 Option 2.1: the fictional human author

Some jurisdictions have enacted legislation to set up a legal fiction, so that authorship of AI-generated works is conferred to the agents expending skills, labor and efforts to create, train, or instruct the AI in the first place. This policy approach emerged quite early, when the creative potential of machine learning and AI was wholly unknown.¹⁰⁵ The United Kingdom was the first jurisdiction to provide specific protection to computer-generated creativity.¹⁰⁶ Section 9(3) of the Copyright Designs and Patents Act 1988 (CDPA)¹⁰⁷ clarified that for

¹⁰⁴ Gervais (n 87) 54.

¹⁰⁵ In the UK, the copyright protection of a computer-generated sequence for a lottery was discussed as early as 1985 in *Express Newspapers v Liverpool Daily Post*. Justice Whitford allowed copyright protection for the automated output to the Plaintiff and refused the notion that copyright in the work could vest in the computer. The computer is a mere tool for creation, arguing that the computer is the author is similar to suggesting that in a written work, “it is the pen that is the author of the work rather than the person who drives the pen.” *Express Newspapers Plc v Liverpool Daily Post & Echo Plc* [1985] 1 WLR 1089, 1098 (UK).

Computer: The Devolution of Human Creativity and Granting Musical Copyrights to Artificially Intelligent Joint Authors” (2018) 40 Cardozo L Rev 387; Andres Guadamuz, “Do Androids Dream of Electric Copyright? Comparative Analysis of Originality in Artificial Intelligence Generated Works” (2017) *Intell Prop Quarterly* 169, 169–89.

¹⁰⁷ Copyright, Designs and Patents Act 1988, § 9(3) (UK).

computer-generated works, the author is the person who undertakes the arrangements necessary for the creation of the work. In addition, Section 178 provides that “computer-generated, in relation to a work, means that the work is generated by computer in circumstances such that there is no human author of the work.”¹⁰⁸ Under this regime, the term of protection for computer-generated works would be 50 years from when the work was made. Shortly thereafter, other common law countries, including Hong Kong, India, Ireland, Singapore, and New Zealand, enacted similar legal arrangements.¹⁰⁹

However, the fictional human author policy approach might be suboptimal for at least two orders of reason. The first reason is of practical nature. This approach makes it tricky to determine who is the person in charge of the necessary arrangements.¹¹⁰ Does the AI-generated work belong to the person who built the system, such as the software developer; the manufacturer; the person who trained it; or the person who fed it specific inputs like a user?¹¹¹

(1) *The programmer.* A first possible answer to the question was provided in *Nova Productions v Mazooma Games*, which applied Section 9(3) of the CDPA. The case concerned copyright on frame images generated by a computer program using bitmap files and displayed on the screen when the users played a snooker video game. The court refused to grant authorship to the user as their input was not artistic in nature.¹¹² Instead, the Court found the programmer was the sole author, as the person who made the necessary arrangements, by noting that “[t]he arrangements necessary for the creation of the work were undertaken by [the plaintiff] because he devised the appearance of the various elements of the game and the rules and logic by which each frame is generated and he wrote the relevant computer program.”¹¹³ In truth, the *Nova Productions* outcome might be a direct consequence of the rudimentary technology at stake;¹¹⁴ however, vesting authorship in the programmer of AI-generating content raises at least three fundamental critiques. First, the allocation of authorship to the software developer might be a blatant misperception.¹¹⁵ In fact, at least in state-of-the-art neural network-based creativity, there seems to be no direct causal connection between the software developers and the final AI-generated output, as the expression embedded in that output would be the result of the training of the machine and the instructions given to create that specific output. Second,

given that this legal fiction is precisely meant to provide incentives to create AI-generated works, where its public domain status would presumptively fail to do so, a sound economic analysis would probably discourage a policy option that rewards the same market player twice. Actually—as the Beijing Internet Court highlighted in a case mentioned earlier—the software developer has been already rewarded with exclusive rights over the software that generates works.¹¹⁶ Third, from a more practical perspective, this policy solution would potentially entitle coders to aggressive copyright protection for innumerable pieces of creativity,¹¹⁷ which would also lower any incentive for the original programmer to create more software.¹¹⁸

(2) *The user.* Allocating rights in AI-generated output to the user of the generator program has been claimed to be a sounder solution.¹¹⁹ Pamela Samuelson has argued that the user is the reason the AI-generated work comes into being, thus “[i]t is not unfair in these circumstances to give some rights to a person who uses the work for its intended purpose of creating additional works.”¹²⁰ In the Draft Report on intellectual property rights for the development of artificial intelligence technologies, the European Parliament seemingly endorsed the same view and proposed to entrust the AI users (“the natural person who prepares and publishes [the] work lawfully”) with copyright over AI-generated works, at least unless “the technology designer has not expressly reserved the right to use the work in that way.”¹²¹ The Beijing decision earlier described also suggested this policy option.¹²² This solution would not be novel to copyright standards. For example, in the United States, copyright—and authorship—is given to users for being the instrument of fixation,¹²³ as in the case of a person who tape-records a jazz performance.¹²⁴ In this scenario, the user would be the author of the sound recording, rather than of the jazz performance. Similarly, the user could be construed as the author of the fixation of the AI-generated work. Of course, a specific provision, such as 9(3) CDPA, should be introduced to that end. Most likely, in some exceptional cases, such as when the user does not have any control over the software other than running it, awarding copyright to the user would be a suboptimal policy choice at odds with copyright incentive theory.¹²⁵ In this case joint authorship between users and programmers could be a possible solution, depending on the legal scheme for joint authorship made available by different jurisdictions.¹²⁶

(3) *The Employer.* Another possible legal framework for ensuring protectability, ownership and accountability of AI-generated works has been found in work-made-for-hire

(WMFH) doctrine.¹²⁷ The AI system would be a fictional creative employee or independent contractor of its users—whether they are natural persons or legal entities.¹²⁸ As Samuelson argues, “one who buys or licenses a generator program has in some sense ‘employed’ the computer and its programs for his creative endeavors, similar considerations to those that underlie the work made for hire rule support allocation of rights in computer-generated works to users.”¹²⁹ In truth, this policy option might stand on shaky ground. First, the argument that, also in the case of AI-generated works, employers are treated as authors of “work for hire” works despite having no role in the output¹³⁰ seems to disregard that, as part of the WMFH legal fiction, the underlying work has been created by a human author and fulfills the originality standard under the present legal framework. This would not be the case with AI-generated creativity. Second, this arrangement would face challenges on the ground that it would be a misapplication of the WMFH doctrine as it is difficult to define a legal, contractual employment or agency relationship between a human and a machine.¹³¹ It seems obvious that in order for the WMFH doctrine to apply to AI-generated works some substantial statutory and jurisprudential reconstruction of the notion of “employer” and “employee” must first occur.¹³²

Next to the practical issue of identifying the relevant human agent, the second critique to the fictional human author policy approach is more fundamental and systemic. Would this approach be sustainable under a legal framework that builds upon the internationally endorsed notion of originality as an expression of the author’s personality? Of course, programming, training, and imparting instructions would be unlikely to fulfil the requirement of an original contribution from the human counterparts, as any “expression” would be the result of the AI creative process. As long as the present subjective standard for originality is in place, any fictional human author policy approach would be resting on very shaky ground given the lack of originality of AI-generated creativity. The work itself, whose fictional authorship is attributed to a human agent, would actually remain unoriginal, thus unprotectable. It is worth noting that the “fictional human author” approach was adopted in the UK and other common law countries when “sweat of the brow” or “skill and labour” originality standards were still dominant in those jurisdictions. Since then, as mentioned, the personality standard for originality has apparently replaced any alternative approach.¹³³ This change would challenge Section 9(3) CDPA policy approaches’ systemic compliance.

5.2.2 Option 2.2: the A(I)uthor

One policy option would be to construe the AI as the author. A fiction would have to be established in the law to provide AI with legal personality, so that it can author a work and own a copyright, or at least the law should be amended to reflect the fact that a computer can be an author in a joint work with a person.¹³⁴ According to Perlman, the law should recognize sufficiently creative AIs as authors when the AI creation is original and developed independently from human instructions, so that the AI is the cause of creativity, not a mere machine working under the instructions of a human author.¹³⁵ Once the AI is declared the author, rights would immediately be assigned to a natural or legal person, such as the creator/programmer of the AI, the user of the AI, or as a joint work.¹³⁶ The law should identify the person entitled to receive the transfer and exercise the rights.

According to the scholarship,¹³⁷ however, this is a fairly residual policy option as it must face at least two fundamental critiques. First, the machine should be entrusted with some form of legal personality, which seems an unlikely policy choice at the moment.¹³⁸ Again, meeting the requirement of originality could be an insurmountable burden for a machine. The notion of originality most likely should be tweaked to include works originating from a machine according to an objective rather than subjective originality.¹³⁹ Overall, allowing AI as author would require substantial amendments to the legal framework. As noted, given the early state of technological development, amending the law before truly intelligent machines have even materialized—and whose materialization and evolution remains as of today just a hypothetical guess—might be a suboptimal policy option.¹⁴⁰

5.3 Option 3: *Sui Generis* Protection of AI-Generated Creativity

Given the difficulties in applying the copyright paradigm to AI-generated creativity, proposals have been also suggesting the creation of a related *sui generis* right—where no authorship or originality would be a necessary requirement—that might protect the investment made in developing and training AI-generating creativity. A few policy alternatives might be available.

¹³⁴ See eg Pearlman (n 127) 1, 29–35; Jani Ihalainen, “Computer Creativity: Artificial Intelligence and Copyright” (2018) 13(9) JIPLP 724.

¹³⁵ Pearlman (n 127) 1.

¹³⁶ Cf also Abbott (n 115) 334 (noting that the machine would be an author/inventor without being an owner and “[t]he computer’s owner should be the default owner of any CGW it produces”); Abbott (n 93) 1121.

¹³⁷ See eg Bonadio and McDonagh (n 96) 112, 116; Ralston (n 94) 302–3; Farr (n 93) 79; Samuelson (n 50) 1199–1200.

¹³⁸ See section 3.1.

¹⁴⁰ See Huson (n 88) 77–8; Yvette Joy Liebesman, “The Wisdom of Legislating for Anticipated Technological Advancements” (2010) J Marshall Rev Intell Prop L 10 153, 172.

5.3.1 Option 3.1: protecting investment

Sui generis rights modelled after database or neighbouring rights have been suggested for protecting AI-generated creativity. For example, while denying protectability under the traditional copyright scheme, the Australian Copyright Law Review Committee noted that, if computer generated creativity needs protection, this should be “more akin to that extended to neighbouring rights [...] the protection extended to performers, producers of phonograms and broadcasting organizations.”¹⁴¹ In this respect, broadcasting rights might serve as reference as they exist notwithstanding that the underlying sport event cannot enjoy copyright protection. Again, McCutcheon has suggested a *sui generis* rights regime for AI-generated creativity similar to database rights, therefore protecting investment in the creation but not requiring an author, nor authorship, nor originality.¹⁴² With the goal of limiting overbroad protection of algorithmic creativity, some authors propose a thin scope of the *sui generis* right, coupled with strong fair use safeguards, with a short duration of around three years or so.¹⁴³

5.3.2 Option 3.2: the disseminators’ right

Further proposal would like to provide rights to publishers and disseminators of AI-generated works. On one side, the regime for anonymous/pseudonymous works could be applied to AI-generated works. According to several national regimes, such as Spain, France, Italy, and Sweden,¹⁴⁴ the person who publishes the work will exercise the rights. On the other side, an additional policy option could provide to the disseminator of AI-generated creativity a right similar to the EU’s publisher right in previously unpublished works as in Art. 4 of Directive 2006/116/EC.¹⁴⁵ Under this scheme, the protection covers the first lawful publication/communication of previously unpublished public domain works. Similarly, AI-generated works would be in the public domain, therefore the “disseminator” scheme would only reward someone for the dissemination of AI-generated creation. The duration of the right could be limited to, for example, 25 years, as in the case of Art. 4 of Directive 2006/116/EC.¹⁴⁶

5.3.3 Option 3.3: protecting goodwill against unfair competition

Other policy proposals have been especially targeting unfair competition in the market for AI-generated works. Japan, for example, have been considering a novel *sui generis* regime for non-human-created intellectual property based on a trade mark-like approach with an emphasis on protection against unfair competition.¹⁴⁷ This approach seeks to limit the protection of AI works by allowing flexibility in levels of protection based on popularity of the AI-generated works as a proxy for goodwill.¹⁴⁸ This would leave out obscure works created for

the sole aim of copyright protection. The proposal would allocate ownership of the work to the individual or company that had created the AI.¹⁴⁹

6. CONCLUSIONS: IP THEORIES IN SEARCH OF AN A(I)UTHOR

Anthropocentrism strongly influences the present copyright legal framework. Thus, AI-generated creativity falls short of all fundamental requirements for granting copyright protection, including legal personality, authorship, and originality. As a reaction, utilitarian/incentive approaches push for the adoption of legal fictions to protect and incentivize AI-generated creativity. These policy solutions, unfortunately, do not satisfactorily address systemic inconsistencies. Even if the law fictionally claims that the work is human-made rather than AI-made, the work itself remains unoriginal as machines will be inherently incapable of originality under a personality standard. Only a fundamental overhaul of the copyright system, pushing away the present anthropocentric approach, can provide full copyright protection to AI-generated creativity proper, when no human intervention can be construed as an original expression. This would be ill-considered, especially given the primitive stage of technological development in the field. Given the systemic difficulties of extending the copyright regime to AI-generated works, residual *sui generis* approaches are also available and, most likely, a preferable option. If policymakers chose to provide monopolistic incentive to AI-generated creativity, the incentive should fall upon the users, if they contributed any meaningful labor and effort to the AI-generated output, as programmers, marketers, and investors would be double-dipping on earlier rewards over the AI-generating content software.

The question that lies ahead is whether any incentive for AI-generated creativity is at all necessary. This policy question should be answered from an empirical perspective, carefully weighing positive and negative externalities of introducing new forms of protection of algorithmic creativity. In this respect, what follows will enlist the help of IP theories to disentangle this policy conundrum by testing the introduction of new exclusive rights over AI-generated creativity against each of the major theoretical justifications of IP.

First, a justification for new exclusive rights for AI-generated works might be found in Lockean fairness theory, which strongly influenced the common law system. Under this theoretical approach, labor and efforts deserve a fair compensation, while a tight causal relationship between the work and the personality of the author becomes less relevant. Therefore, both copyrights and *sui generis* rights might be a sustainable option under this theoretical perspective. Most likely, the economic incentive should reward users of technologies generating creativity.

Instead, the personality theory might be unfit to justify any copyright protection of algorithmic works. The personality theory's construction of the work as an extension of the personality—and humanity—of the author makes it hard, if not impossible, to make room for copyright protection of AI-generated works when the causal link between human agents and the work is so weakened that no protectable expressions deriving from free human choices can be found. The machine, on the other side, is not human, nor self-conscious; thus it cannot

¹⁴⁹ Ibid.

enjoy any personality and its contribution would not qualify as copyright-protectable from a personality theory perspective.

Again, utilitarian theories, as interpreted in light of welfare theory, incentive theory, and economic analysis of law, would like to implement regulatory solutions that generate positive externalities for society at large, rather than authors and innovators alone. From a utilitarian perspective, progress is maximized by social policies that generate the greatest happiness for the greatest number of people. In this respect, the final goal of creativity and innovation policy is social progress, which is not the same as mere technological development.¹⁵⁰ Therefore, although the economic value that might arise from the development of AI-generating creativity would be a relevant positive externality, policy changes must bring about overall advantages for society as a whole in terms of social progress. Actually, plentiful arguments might be raised against the notion that incentivizing algorithmic creativity via exclusive rights might generate more positive externalities than negative. While, on one side, there is no evidence that new exclusive rights might incentivize AI industry growth, on the other side such exclusive rights might increase copyright overall transaction costs and negatively affect cultural diversity and identity culture.

On this point, first, some evidence should be provided that the proposed incentives align with the AI industry business models and might incentivize investment in the AI sector. The need for such incentives should be empirically proven, together with the positive externalities that they might bring about for the creative ecosystem. In fact, there is well-established historical evidence that property rights are not the only incentive to creativity.¹⁵¹ Miscellaneous research and market evidence show that open and free access to creative works or alternative business models might provide stronger incentive to AI-generated creativity than IP-based protection models,¹⁵² without creating the negative externalities of propertization and exclusive rights. Of course, it is worth noting that AI itself does not need any incentive to create and exclusive rights provided by copyright and patents over the technologies generating creative works might already constitute an incentive sufficient enough for the human agents involved. In addition, other legal tools, such as protection against unfair competition, might provide an adequate remedy against infringement.

Second, in the context of the maximization of positive externalities, a truly challenging question deals with how AI-generated creativity impacts cultural diversity and identity politics.¹⁵³ In particular, AI-generated creativity might homogenize online and offline content. Actually, algorithmic creativity has an inherent propensity to average mainstream ideas and perspectives. Neural networks train by acritically collecting information and learn from that training how to create new content. Of course, the new content will reflect all bias and pre-conceptions of the original database. The machine can only process weighted averages of the collected information and, thus, generates content that reflects those averages. The divergence,

which is typical of original human thought, seems intrinsically less probable in algorithmic processes generating content.

Third, protecting algorithmic creativity might bring about further negative externalities by actualizing the “infinite monkey theorem” of French mathematician Émile Borel,¹⁵⁴ thus expanding copyright transactional costs to the point of systemic failure. Borel’s theorem argues that a monkey randomly hitting the keys of a typewriter for an infinite amount of time will “almost” surely type any possible text, such as the complete collection of Shakespeare’s works.¹⁵⁵ Jorge Luis Borges evokes, as a possible result of the work of Borel’s monkeys, the “Biblioteca Total,” which would contain any possible work written and to be written.¹⁵⁶ Actually, Borel’s monkey is a metaphor representing a hypothetical mechanical tool capable of creating an infinite random sequence of letters and symbols. Today, Borel’s theorem has become almost reality given the extraordinary—and impossible to predict, at the time Borel lived—development of computational sciences. This development—and the actualization of Borel’s theorem—would further affect transactions costs related to that “copyright soup” that, according to William Fisher, has become already too thick in the digital environment.¹⁵⁷ AI creative capacities might scale up at the pace of singularity, flooding the cultural marketplace with an unmanageable mesh of rights to clear. If new copyright or *sui generis* rights are granted over AI-generated works, copyright trolling might escalate to a phase of final computational doom. Infinite AI monkeys might eat up all the “copyright soup,” so that no creative materials will be left to use.

Finally on the issue of the theories addressed herein, also cultural theories might not provide justification to the introduction of new exclusive rights protecting AI-generated creativity. Instead, the pursuit of happiness via the realization of universal human values, such as culture—which is the final goal in the creativity domain of the normative system promoted by this theoretical approach—might suggest disincentivization, rather than incentivization, of the generation of algorithmic works. The widespread availability of algorithmic creativity, possibly autonomously generated by machines, would not accrete human culture but, if any, algorithmic culture. Human culture, in contrast, would be harmed by the limitation of professional and expressive space available to human agents. Meanwhile, as mentioned above, the cultural ecosystem might suffer negative externalities in terms of diversity of creative works, which is a central value of the social project of cultural theory.

In sum, a review of theoretical justifications for IP rights would suggest caution in extending them to AI-generated creativity. IP theories in search of justifications for protecting AI-generated works might not finally find any A(I)uthor.
