

# Seminar 6 Expanding Horizons: A Broad Perspective on Global AI Regulation Trends

Dr Zihao Li  
Senior Lecturer in Technology Law  
Course Convenor

**Semester 6**  
**27 February 2026**

# Course Structure

1. Recap & Overview:
2. European Union: A Risk-based Approach
  1. AI Act
  2. WIP Workshop
3. United Kingdom: A Principles-Based Approach
  1. Five Cross-Sectoral Principles
  2. Sectoral Regulators
  3. UK Government consultation
  4. The Artificial Intelligence (Regulation) Bill
4. China: A Top-Down, Industry-Specific Approach
  1. Recommendation algorithms, deep synthesis (deepfakes), generative AI services
  2. AI watermarking, and Anthropomorphic AI regulation
5. United States: A Fragmented Environment
  1. State level
  2. Federal level
6. Group Activity

# Part I – Recap & Overview of Regulatory Approaches

# European Union: A Risk-based Approach

# Recap of Last Seminar

## Overview of Risk-based Approach :

1. Hierarchical Framework
2. Different types and functions of AI

## Type of AI in AI Act:

- Unacceptable AI
- High-risk AI
- Limited-risk AI
- General-purpose AI

## Different obligations:

1. Prohibition;
2. Conformity assessment
  1. Risk management,
  2. Data governance,
  3. Technical documentation,
  4. Record keeping;
  5. Transparency;
  6. Human oversight;
  7. Accuracy & cybersecurity
3. Transparency

# General-purpose AI Obligation in AI Act

## Template for the Public Summary of Training Content for General-Purpose AI models

This template is provided by the European Commission and required to be filled in by providers of general-purpose AI models prior to their placing on the Union market in order to comply with their obligation under Article 53 (1)(d) of Regulation (EU) 2024/1689 (AI Act).

For more information and guidance see Commission's [Explanatory Notice and Template for the Public Summary of Training Content for general-purpose AI models](#) | [Shaping Europe's digital future](#).

Version of the Summary: Version of the summary, with link(s) to previous versions where applicable  
Last update: Click or tap to enter a date.

### 1. General information

#### 1.1. Provider identification

Provider name and contact details: Replace this with your response...

Authorised representative name and contact details: Only applicable if the provider is established outside the Union (see Article 54 AI Act).

#### 1.2. Model identification

Versioned model name(s): Provide the unique identifier(s) for the model(s) or model version(s) covered by this Summary (e.g. Llama 3.1-405B). In accordance with point 30 of the Commission Explanatory Notice to the Template, the same Summary may be used for different model(s) or model version(s) provided the content of their respective Summaries is identical. Where available, provide link(s) to additional publicly available documentation, such as the model card, for the model(s) or model version(s).

Model dependencies: If the model is the result of a modification, including fine-tuning, of one or more general-purpose AI models already placed on the Union market, specify the model (version) name(s) of that/those models and provide a link to their Summary(ies) where available.

Date of placement of the model on the Union market: Indicate the date on which the model was placed on the Union market (including the dates each model (version(s)) was placed on the market, if the Summary applies to more than one model or version (see point 30 of the Commission Explanatory Notice to the Template).

#### 1.3 Modalities, overall training data size and other characteristics

*This Section requires general information about the overall training data after pre-processing and before the training of the model.*

| Modality                                                                                     | Training data size                                                                                                                                                              | Types of content                                                                                                              |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Select the modalities present in the training data, to the extent that they are identifiable | For each selected modality, select the range within which the estimated total training data size for that modality falls. Dynamic datasets may be excluded from the estimation. | For each selected modality, provide a general description of the type of content that has been included in the training data. |

|                                             |                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                           |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <input type="checkbox"/> Text               | <input type="checkbox"/> Less than 1 billion tokens<br><input type="checkbox"/> 1billion to 10 trillions tokens<br><input type="checkbox"/> More than 10 trillions tokens<br><br>Alternatively, specify the approximate size in a different measurement unit:<br><i>Replace this with your response...</i> | <i>Examples of possible types of content include fiction and non fiction text, scientific text, press publications, legal and official documents, social media comments, source code.</i> |
| <input type="checkbox"/> Image              | <input type="checkbox"/> Less than 1 million images<br><input type="checkbox"/> 1Million to1 billion images<br><input type="checkbox"/> More than 1 billion images                                                                                                                                         | <i>Examples of possible types of content include photography, visual art works, infographics, social media images, logos, brands.</i>                                                     |
| <input type="checkbox"/> Audio <sup>1</sup> | <input type="checkbox"/> Less than 10 000 hours<br><input type="checkbox"/> 10 000 to1 million hours<br><input type="checkbox"/> More than 1 million hours                                                                                                                                                 | <i>Examples of possible types of content include musical compositions and recordings, audiobooks, radio shows and podcasts, private audio communication.</i>                              |
| <input type="checkbox"/> Video              | <input type="checkbox"/> Less than 10 000 hours<br><input type="checkbox"/> 10 000 to1 million hours<br><input type="checkbox"/> More than 1 million hours                                                                                                                                                 | <i>Examples of possible types of content include music videos, films, TV programmes, performances, video games, video clips, journalistic videos, social media videos.</i>                |
| <input type="checkbox"/> Other              | <i>Specify the modality and for each one indicate approximate size and unit of measurement</i>                                                                                                                                                                                                             |                                                                                                                                                                                           |

Latest date of data acquisition/collection for model training: Indicate the latest date when data was collected/obtained for the model training: MM/YYYY. Additionally, indicate if the model is continuously trained on new or dynamic data after this date.

Description of the linguistic characteristics of the overall training data: Where applicable, describe the languages covered by the training data (e.g., text, videos or speech), focusing in particular on EU official languages.

Other relevant characteristics of the overall training data: Where such information is readily available and in so far as it is relevant and practicable, describe other relevant characteristics of the overall training data, such as national/regional or demographic specificities of the training data.

Additional comments (optional): Providers may also disclose other relevant information on a voluntary basis (e.g. the compression or tokenization methodologies applied for the data size calculation, the sampling frequency/rate plays for audio or video content).

### 2. List of data sources

*This Section requires information about specific sources of data used to train the general-purpose AI model. In this section "dataset" should be understood as a single, pre-packaged collection of data. The filtering and pre-processing of data collected from the same pre-packaged collection should not be considered a new dataset to be disclosed separately in the sections below. If a particular dataset can be assigned to more than one of the categories below, providers should select the most relevant category and only report the dataset in that category, except in the case of synthetic data (see Section 2.5).*

#### 2.1. Publicly available datasets

*This Section requires information about datasets that were used to train the model and which have been compiled by a third party, are made available publicly for free, and are readily downloadable as a whole or in predefined chunks, such as datasets and collections available on public repositories and online platforms, specialised websites, or snapshots of common crawl. The public availability of the datasets for free does not*

### 2. List of data sources

*This Section requires information about specific sources of data used to train the general-purpose AI model. In this section "dataset" should be understood as a single, pre-packaged collection of data. The filtering and pre-processing of data collected from the same pre-packaged collection should not be considered a new dataset to be disclosed separately in the sections below. If a particular dataset can be assigned to more than one of the categories below, providers should select the most relevant category and only report the dataset in that category, except in the case of synthetic data (see Section 2.5).*

#### 2.1. Publicly available datasets

*This Section requires information about datasets that were used to train the model and which have been compiled by a third party, are made available publicly for free, and are readily downloadable as a whole or in predefined chunks, such as datasets and collections available on public repositories and online platforms, specialised websites, or snapshots of common crawl. The public availability of the datasets for free does not*

<sup>1</sup> Excluding audio that is part of video, as this should be reported under the "video" modality instead. Furthermore, the Commission understands the modality of 'audio' to include 'speech'.

*mean that the content at issue is necessarily free of rights since it may be subject to licensing arrangements or conditions of use (e.g., certain free and/or open licenses may determine the scope of the uses, including prohibiting uses relating to model training).*

*A dataset is considered to be "large" if the total data size for any one of the modalities contained in the dataset exceeds 3% of the size of all publicly available datasets for that modality used for training. The size of the dataset should be based on its size after pre-processing (for example filtering), and without splitting the dataset to prevent reporting circumvention.*

Have you used publicly available datasets to train the model? ☐ Yes ☐ No

If yes, specify the modality(ies) of the content covered by the datasets concerned: ☐ Text ☐ Image ☐ Video ☐ Audio

☐ Other *If so, please specify...*

List of **large** publicly available datasets: For each large dataset, provide the identifier/name of the dataset and a link through which the dataset can be accessed. If a link is not available, provide a general description of the dataset, including the approximate start and end dates of the data collection if known (otherwise indicate "not known"). If only part of the datasets has been used for the training, indicate the general approach to selecting those parts.

General description of other publicly available datasets not listed above: For other publicly available datasets that are not listed above, provide a general description of their content. The description could include indication of: (i) the types of modality (e.g. text, images), (ii) nature of the content (e.g. personal data, copyright protected content, machine generated data such as Internet of Things or synthetic data), (iii) its linguistic characteristics, where applicable. (iv) the approximate start and end dates of the data collection if known (otherwise indicate "not known").

Additional comments (optional): Providers may also disclose other relevant information on a voluntary basis, e.g. size of the datasets and other relevant details.

#### 2.2 Private non-publicly available datasets obtained from third parties

*This Section requires information about private non-publicly available datasets of third parties that are not publicly available and not disclosed under Section 2.1. These include:*

- datasets for which transactional commercial licensing agreements were concluded between the provider and the rightsholders or their representatives, including by collective management organisations and legitimate content aggregators who have the right to collectively license works on behalf of rightsholders (Section 2.2.1);*
- other private datasets obtained through data intermediaries, non-publicly available databases and*

# General-purpose AI with systemic risks in AI Act

How should Signatories assess and mitigate the systemic risk of their general-purpose AI model with systemic risk (GPAISR)?

**Disclaimer:** This figure is for presentational clarity only and is without prejudice to the specific wording of the Commitments and Measures in the third draft of the Code of Practice.

# Paris Summit: From “Safety First” to “Development First”

Paris AI Action Summit 2025

Compared with the **2023 Bletchley Summit in the UK** and the **2024 Seoul Summit in South Korea**, the shift in countries' attitudes toward AI governance at this meeting was clear: the dominant tone moved toward **AI innovation and development**.

As a result, **international AI competition** is likely to enter an even more intensified phase in the future.

# EU: Digital Omnibus Simplifications

## What the proposal does

- Targeted amendment to the AI Act, not a replacement; reduce compliance burdens, improve usability, and better align implementation with market readiness.
- Focuses on making the regime easier for SMEs and newly included SMCs (small mid-cap enterprises).

## Main simplifications

- High-risk AI timeline becomes conditional, not purely date-based
  - High-risk obligations would start only after the Commission confirms that key compliance support measures are available
  - Extended from 2 August 2026 to 2 December 2027; Annex I product-related AI: latest by 2 August 2028.
- Reduced burden for SMEs and SMCs
  - Simplified technical documentation formats
  - More lenient fine ceilings and more room for non-monetary enforcement measures
- Conformity assessment is streamlined
  - “Single application” and “single assessment procedure” for notified bodies in relevant cases.
  - More reuse of existing documents from other product-law procedures.

# EU: Digital Omnibus Simplifications

## Main simplifications

- Post-market monitoring becomes more flexible
  - The proposal moves away from rigid template-based requirements and relies more on Commission guidance.
- Sandboxes and real-world testing are expanded
  - Stronger EU-level sandbox role.
  - Wider scope for real-world testing
- Conformity assessment is streamlined
  - “Single application” and “single assessment procedure” for notified bodies in relevant cases.
  - More reuse of existing documents from other product-law procedures.
- ✓ **Lower short-term compliance costs vs. ✗ Transparency may be weakened**
- ✓ **Less risk of rushed compliance vs. ✗ Rights protections may be delayed**
- ✓ **More innovation-friendly vs. ✗ Legal uncertainty may increase in some areas**

# EU: Digital Omnibus Simplifications

## Data Protection in AI

- EDPS v SRB: Pseudonymous data is not always personal data; creation of impersonal data
- Relative approach for personal / non-personal data

## Digital Omnibus even goes further

1. The proposal adds a new negative sentence to the definition  
“Such information does not become personal for that entity merely because a potential subsequent recipient has means reasonably likely to be used to identify the natural person to whom the information relates.
2. Commission getting implementing power on when pseudonymised data stops being personal  
“An implementing act as proposed could de facto affect the material scope of EU data protection law, effectively redefining the scope of when and for whom information is considered personal data.”

The background features a light grey grid of circles, each containing a smaller pink circle. A large, light grey triangle is positioned in the bottom right corner. The text is centered in the middle of the slide.

# **Part III – United Kingdom: A Principles-Based Approach**

# United Kingdom: A Principles-Based Approach

## No overarching statutory AI regulation

- UK relies on existing laws (e.g., GDPR, Equality Act 2010)
- Government's intention to strike a balance between fostering technological advancement and ensuring the responsible development and use of AI, emphasizing a framework that is both flexible and adaptable to the evolving nature of AI

## Principles-based & sectoral approach

Feb 2024 Response to White Paper consultation: 'A Pro-Innovation Approach to AI Regulation'

Five cross-sectoral principles for AI oversight:

1. Safety, security and robustness;
2. Appropriate transparency and explainability;
3. Fairness;
4. Accountability and governance;
5. Contestability and redress

# United Kingdom: A Principles-Based Approach

## Definition of AI

- No formal definition of AI. Instead, an outcomes-based approach, which focuses on two defining characteristics - **adaptivity** and **autonomy** - will guide sectoral interpretations.
- UK regulators, like Ofcom or the Financial Conduct Authority (FCA), can interpret adaptivity and autonomy to create domain-specific definitions, if beneficial. This raises the risk that different interpretations by regulators could create regulatory uncertainty for businesses operating across sectors. To address this, the Government plans to establish a Central Function to coordinate among regulators (ICO, CMA, FCA, Ofcom etc.)

| Highly capable general-purpose AI                                                                                                                                                                                                                                                                                                                                | Highly capable narrow AI                                                                                                                                                                                                                                                                                                                                            | Agentic AI or AI agents                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>▪ Foundation models that can perform a wide variety of tasks.</li><li>▪ Their capabilities can match or exceed those present in today's most advanced models.</li><li>▪ Such models will span from novice through to expert capabilities, with some even showing superhuman performance across a range of tasks.</li></ul> | <ul style="list-style-type: none"><li>▪ Foundation models that can perform a narrow set of tasks, normally within a specific field like biology.</li><li>▪ Their capabilities can match or exceed those present in today's most advanced models.</li><li>▪ Generally, such models will demonstrate superhuman abilities on these narrow tasks or domains.</li></ul> | <ul style="list-style-type: none"><li>▪ An emerging subset of AI technologies that can competently complete multiple sequential steps over long timeframes – e.g. sending email or instructions to physical equipment – to complete a high-level task or goal.</li><li>▪ These systems can use tools such as coding environments, the internet, and narrow AI models to complete tasks.</li></ul> |

# United Kingdom: A Principles-Based Approach

## Creation of Digital Regulation Cooperation Forum (DRCF)

- In order to avoid conflict between different regulatory bodies, the UK government decided to create DRCF to highlight the areas where regulatory coordination is necessary, particularly regarding any supplementary joint regulatory guidance.
- Increase business confidence to follow one regulator's interpretation of the framework's principles in specific use cases – e.g., in relation to transparency or fairness - will not conflict with another.

## Additional funding to boost regulatory capabilities

- Responding to a fast-moving technological landscape will continue to challenge regulators and firms. Department for Science, Innovation and Technology (DSIT) announced £10 million to support regulators in putting in place the necessary tools, resources and expertise needed to adapt and respond to AI. UKRI committed a record £1.6 billion of funding directly targeted at the AI sector over the next four years.

## Copyright and AI: Response by the CREATE Centre to the UK Government's Consultation

Martin Kretschmer, Bartolomeo Meletti, Lionel Bently (University of Cambridge), Gabriele Cifrodelli, Magali Eben, Kristofer Erickson, Aline Iramina, Zihao Li, Luke McDonagh (LSE), Emma Perot (University of the West Indies), Luis Porangaba, Amy Thomas

This paper reproduces the response submitted by CREATE to the UK government's consultation on Copyright and Artificial Intelligence, launched in December 2024 and closed on 25 February 2025. This submission is based on evidence published or reviewed by CREATE as an independent national research centre.

We would like to acknowledge the Institute for Creativity and AI at City St Georges, the Law, Technology and Society Group at the London School of Economics, The University of Oxford / Bodleian Libraries and the British Academy for an early exchange of views and discussions.

# **Part IV – China: A Top-Down, Industry-Specific Approach**

# China: A Top-Down, Industry-Specific Approach

## Proactive, government-led AI regulation

- China is the first major jurisdiction to issue a targeted framework for generative AI: Interim Measures for the Management of Generative Artificial Intelligence Services (2023)
  - Regulator: Cyberspace Administration of China ('CAC'), along with six other Chinese regulators, such as the Ministry of Industry and Information Technology (MIIT) and the Ministry of Public Security – shows Chinese government's emphasis on maintaining control over these critical domains
  - National standardization bodies like TC260 and TC28 contribute to AI governance by developing technical standards and guidelines for the industry – AI watermarking
- Targeted approach: regulates specific AI applications, not a single comprehensive AI law
  - Personal Information Protection Law (2021)
  - Data Security Law (2021)
  - Cybersecurity Law (2016)
  - Algorithm Recommendations for Internet Information Services (2021)
  - Administrative Provisions on Deep Synthesis of Internet-based Information Services (2022)

  - Interim Measures for the Administration of AI Anthropomorphic Interaction Services (Draft, 2026)

# China: A Top-Down, Industry-Specific Approach

## Proactive, government-led AI regulation

- Interim Measures for the Management of Generative Artificial Intelligence Services (2023)
  - **Content Regulation:** Providers are deemed online content producers (Article 9, 14) and must act on illegal content by suspending, removing, optimizing, or reporting it.
  - **Data and Model Requirements:** Training data must come from legitimate sources, respect intellectual property, and process personal data legally (Article 7, 8).
  - **Tagging and Transparency:** Generated content must be tagged per the Provisions on Administration of Deep Synthesis Internet Information Services (Deep Synthesis Provisions), enhancing transparency (Article 12).
  - **User Protection:** Providers must protect user privacy, avoiding unnecessary data collection and identifiable storage, and not disclosing to third parties without consent (Article 11, 15). Users have rights to access, copy, correct, or delete their data, with providers handling complaints promptly.
  - **Security and Compliance:** High-risk services, particularly those with public opinion or social mobilization properties, require security assessments and algorithm filing per the Provisions on Management of Algorithmic Recommendations (Article 17). Providers must cooperate with inspections, obtain administrative permits where mandated, and ensure stable services.
- Key focus areas:
  - Content control
  - Data protection
  - Algorithmic governance
- Reflects strong state oversight & risk-based governance

# China: A Top-Down, Industry-Specific Approach

## Proactive, government-led AI regulation

- Administrative Provisions on Deep Synthesis of Internet-based Information Services (2022)
  - **Content-integrity and anti-deception approach:** targets deepfakes, face-swapping, voice cloning, and other synthetic manipulation primarily as risks of misinformation, impersonation, and fraud.
  - **Provider-based compliance model:** places obligations on service providers to manage security, authenticity, and lawful use
  - **Labelling and traceability approach:** requires identification of synthetic content and supports downstream traceability.
  - **Platform governance logic:** treats deep synthesis as an internet information service problem
- Interim Measures for the Management of Generative Artificial Intelligence Services (2023)
  - **Public-facing service regulation:** focuses on generative AI services provided to the public in mainland China
  - **Development-and-security balancing approach**
  - **Lifecycle compliance approach:** imposes duties across data, training, content generation, and service deployment, linking AI governance with existing rules
  - **Administrative supervision + filing model:** relies on registration, review, and ongoing provider accountability rather than only ex post liability.
- Reflects strong state oversight & risk-based governance

# China: A Top-Down, Industry-Specific Approach

## Proactive, government-led AI regulation

- Measures for Labelling AI-Generated and Synthetic Content (2025)
  - **Transparency-by-design approach:** makes disclosure of AI-generated content a built-in compliance obligation
  - **Dual-label governance model:** combines explicit labels (visible to users) and implicit labels (embedded in metadata)
  - **End-to-end traceability approach:** regulates both production and dissemination stages
  - **Infrastructure-based enforcement:** shifts part of the compliance burden to platforms and dissemination intermediaries
  - **Standardisation as a implementation tool**
- Interim Measures for the Administration of AI Anthropomorphic Interaction Services (Draft, 2026)
  - **Psychological-safety and relational-risk approach:** shifts regulation from content alone to the human-AI relationship layer, especially emotional dependency, addiction, and manipulation risks
  - **Anthropomorphism-specific governance:** treats AI systems that simulate personality, thinking styles, and emotional interaction as a distinct regulatory object
  - **Protective intervention model:** expects providers to monitor excessive use and intervene where users show signs of dependency or emotional distress.

# China: A Top-Down, Industry-Specific Approach

## AI Regulation & National Strategy

### ➤ AI Development Goal: Global Leader by 2030

### ➤ Key regulatory priorities:

- National security & social stability
- Economic development & AI leadership
- Control over public discourse & increase infrastructure capabilities

### ➤ AI Capacity-Building Action Plan

- Expands China's influence in global AI governance
- Emphasizes AI for good & cooperation with developing nations

### ➤ Implications:

- Because the system is built through interim departmental rules and scenario-based regulation, it is relatively flexible and experimental, allowing iterative adjustment over time. This makes the Chinese model adaptable and potentially transferrable
- China's approach may also create de facto global spillover effects through standardisation and technical integration.
- **Standardisation is a major channel of this spillover effect**
- These components can be embedded into **developer tools, workflow templates, compliance dashboards, platform infrastructures, and model release processes**, allowing them to travel across borders through products and supply chains.
- Tools such as **filing systems, security assessments, self-evaluation reports, labelling rules, and watermarking identifiers** are not just legal obligations, but also **technical and operational compliance components**.

# China: A Top-Down, Industry-Specific Approach

## Compliance & Enforcement in China

### ➤ Key Compliance Requirements

- Mandatory algorithm filings with CAC
- Labelling of AI-generated content (deep synthesis)
- Security assessments for AI services
- Strict data processing obligations

### ➤ Enforcement Measures:

- Fines for non-compliance
- Criminal liability in severe cases
- Business disruption (e.g., app suspension) for violations

### ➤ A good attempt for Beijing Effect?

The pragmatism and ambition are evident, but so are the gaps—in enforceability, in doctrinal depth, in coherence. Yet perhaps that's the point. China's strategy isn't about presenting a perfect model but about participating in and influencing the global conversation. In a rapidly evolving field like AI, sometimes it's enough to lead by starting the discussion.

**Questions?**

The background features a series of light pink circles of varying sizes, some of which are partially enclosed by thin white square borders. These circles are arranged in a loose, upward-curving pattern across the top half of the slide. In the bottom right corner, there is a large, solid grey triangle pointing towards the left.

## Mainly focuses on AI research & development

- Reflecting the administration's commitment to AI leadership.
- The public consultation process, with input from diverse stakeholders, ensures a comprehensive approach, covering technical, policy, and geopolitical dimensions.
- While specific details await finalization, the plan's focus on innovation, security, and competitiveness positions the US to shape the future of AI, with potential global implications.

| Table: Summary of Key Objectives and Policy Topics |                                                                |                                                                                     |

*"It is the policy of the United States to sustain and enhance America's global dominance in order to promote human flourishing, economic competitiveness, and national security"*  
— President Donald J. Trump, Executive Order 14179, January 23, 2025

OpenAI respectfully submits the enclosed proposals to the Office of Science and Technology Policy as it weighs a new AI Action Plan that will, as Vice President Vance stated recently at the Paris AI Action Summit, maintain American leadership in AI and "make people more productive, more prosperous, and more free." As America's world-leading AI sector approaches artificial general intelligence (AGI), with a Chinese Communist Party (CCP) determined to overtake us by 2030, the Trump Administration's new AI Action Plan can ensure that American-led AI built on democratic principles continues to prevail over CCP-built autocratic, authoritarian AI.

OpenAI agrees with the Trump Administration that AI creates prosperity and freedom worth fighting for—especially for younger generations whose future will be shaped by how this Administration approaches AI. Globally, most ChatGPT users are under age 35; in the US, about one third are ages 18 to 24.<sup>1</sup> Both young people and their parents recognize the economic opportunities AI presents:

- More than seven in 10 parents in the US believe children today will be worse off financially than they are.<sup>2</sup>
- Nine in 10 US parents think it's important that their kids learn how to use artificial intelligence for their future jobs—and eight in 10 say either that isn't happening today, or they don't know if it is.<sup>3</sup>
- Three in four college-age AI users want to use AI in their education and careers. Many are teaching themselves and their friends about AI without waiting for their schools to provide formal AI education.<sup>4</sup>

## Response to the National Science Foundation's and Office of Science & Technology Policy's Request for Information on the Development of an Artificial Intelligence (AI) Action Plan

90 Fed. Reg. 9088 (Feb. 6, 2025)

Docket No. NSF\_FRDOC\_0001

March 13, 2025

### Executive Summary

The potential of artificial intelligence is nearly unlimited, and we're already seeing how it can revolutionize healthcare, accelerate scientific discovery, and transform our economy for the better.<sup>1</sup> But a nation's ability to harness AI's enormous benefits requires the right policy frameworks.

Google welcomes the Trump Administration's goal of developing a plan to "sustain and enhance America's global AI dominance."<sup>2</sup> While America currently leads the world in AI—and is home to the most capable and widely adopted AI models and tools—our lead is not assured. As Vice President Vance urged, we must "catch lightning in a bottle" and unlock AI's potential.<sup>3</sup> To do that, we recommend focusing on three key areas to secure America's position as an AI powerhouse and support a golden era of opportunity:

1. **Invest in AI:** The Administration can take decisive actions to supercharge U.S. AI development, including:
  - a. Coordinated federal, state, local, and industry action on policies like transmission and permitting reform to address surging energy needs, an essential part of expanding AI infrastructure.

## 2025 State AI Wave Building After 700 Bills in 2024

**WASHINGTON** – US states considered almost 700 legislative proposals related to artificial intelligence (AI) in 2024 covering a range of issues, according to a new BSA | The Software Alliance analysis. And the states' focus on AI is only set to accelerate early in 2025.

Forty-five states took up AI-related legislation this year, and just under 20 percent of those bills were ultimately enacted into law. The increased pace of activity is considered a precursor to renewed state legislative efforts on AI in early 2025.

- States like Colorado, California, Illinois are leading AI regulation
- Creates a patchwork of AI rules across jurisdictions

# United States: A Fragmented Environment

## Regulations in different States

- New York bill on algorithmic pricing (Assembly Bill A1417A / Senate Bill S7882)
  - **restrict landlords from using algorithmic pricing tools to set rent for residential tenants**, especially where those tools rely on market or competitor data in ways that may facilitate coordinated or distorted pricing outcomes
- Companion AI regulation
  1. New York

**Assembly Bill A6767 (2025)** directly targets **AI companion models**. Prohibit providing an AI companion unless the system includes protocols for handling signs of **suicidal ideation, self-harm, physical harm to others, and financial harm to others** expressed by users.

It also requires notifications about **crisis service providers** and disclosure of the **non-human nature** of the AI companion
  2. California

**California SB 243 (Companion Chatbots)**

Regulates **companion chatbots as a distinct category**; focus on **mental health safeguards**, including reporting duties and protocols relating to **suicidal ideation and crisis response**.
  3. Maine

**Maine Revised Statutes, Title 10, section 1500-DD** requires disclosure of the use of an **artificial intelligence chatbot** in trade and commerce

Targets **deceptive anthropomorphism**: where a reasonable consumer might think they are interacting with a human

# United States: A Fragmented Environment

“My Administration must act with the Congress to ensure that there is a minimally burdensome national standard — not 50 discordant State ones. The resulting framework must forbid State laws that conflict with the policy set forth in this order. That framework should also ensure that children are protected, censorship is prevented, copyrights are respected, and communities are safeguarded. A carefully crafted national framework can ensure that the United States wins the AI race, as we must.”

**Questions?**

# Part V – Group Activity

## Group Discussion

**Please discuss the pros and cons of each approach in different jurisdictions**

1. Identify the characteristics and trend
2. Identify regulatory/policy targets
3. Analyse what kind of challenges they might face?
4. Advantages?
5. Consider their socio-economic and technological situation

# THANK YOU!
