

Seminar 4: Formative Assessment

Aline Iramina

06 February 2026

Formative assessment – Questions?

Question:

*Using the theories of regulation discussed in this course, **critically assess** the EU's decision to adopt a risk-based regulatory approach in the AI Act. Draw on the course readings to analyse whether and how these theories help to explain the advantages and limitations of the EU's approach, and its decision to govern AI in this way.*

Word limit: 1000 words (including footnotes)

Deadline: **13 February 2026, 4pm**

AI – GenAI assessments

For this course assessment, as general rule, generative AI is not allowed. For example, students should not:

- *Generate content or summaries and copy these into the assessment.*
- *Rewrite sentences, redraft paragraphs or make other substantive changes to original text (though you could ask for feedback and then implement changes based on that feedback – using AI).*
- *Rewrite bulleted lists or notes into sentences and paragraphs.*
- *Generate essay plans other suggestions for structuring content or documents for an assessment, for instance reports, presentations, case studies etc.*
- *Look up the answers for short-note or multiple-choice exams.*

While in general (as above) students are NOT permitted to use GenAI in their assessment, there are some exceptions, for example:

- *Students are still permitted to use dictionaries, thesauri, spelling and grammar-checking software **to help identify and correct spelling mistakes and grammatical errors** (even if they are powered by GenAI). Writing assistance tools that are driven or enhanced by AI and that are integrated into software provided by the university, for instance, **autocorrection and word suggestion as well as editor tools that make suggestions for better grammar and sentence structure are also permitted**. Students can also use software **to provide feedback on their written content**.*

AI – Good Practices in the Use of AI

- Do **not** assume that all AI tools are equally effective, equally responsible, equally resourceful, and equally capable of being used with academic integrity. AI tools replicate biased results, and do not provide contextualised, evaluated or critiqued evaluation of information.
- Don't use AI tools as a replacement for your own understanding, analysis, or summary of a topic.
- **Ensure that all your submissions are the result of your own thought, workings, analysis, and critique.**

Using AI in coursework, exams, research or study without acknowledge is considered academic misconduct.

Any use of generative AI tools must be accompanied by critical analysis and oversight on the part of the user.

AI – Good Practices in the Use of AI

According to the University of Glasgow's recommendation:

- Be clear, open and transparent in your use of AI!
- Name and version of the AI platform used (e.g., ChatGPT-3.5)
- Brief description of how the tool was used.
- Ideally, include details on the prompts that were used.

E.g.,

Declaration: I acknowledge the use of ChatGPT 3.5 (Open AI) as a tool to proofread the final version of this work, including grammar and spelling corrections. No AI-generated content was used in the development of argument or analysis. This work is entirely original and in the author's own writing.

Thank you!
