

Seminar 5 Right-based approach to regulating artificial intelligence technology: the case of the EU

Dr Zihao Li
Senior Lecturer in Law and Technology
Course Convenor

Semester 5
13 February 2026

Course Structure

1. Recap & Overview: Risk-based approach
 1. Overview hierarchical framework
 2. Different types and functions of AI
2. What is General purpose AI?
 1. Systemic risks
3. What are the obligations for General purpose AI developers?
4. The right-based approach to regulate AI
 - Foundation
 - Data Protection rights
 - Freedom of expression and information
 - Freedom of science and academia
 - Economic rights related to work, conducting a business and property
5. Group Activity
6. Conclusion

The background features a light grey grid of circles. Most circles are pink, but some are white with pink outlines. A large, light grey triangle is positioned in the bottom right corner, pointing towards the top left.

Part I – Recap & Overview of the course

Recap of Last Seminar

Overview of Risk-based Approach :

1. Hierarchical Framework
2. Different types and functions of AI

Type of AI in AI Act:

- Unacceptable AI
- High-risk AI
- Limited-risk AI
- General-purpose AI

Different obligations:

1. Prohibition;
2. Conformity assessment
3. Transparency

Group 10. AI as complex-technical systems

1. Privacy data protection: AI companies are using almost all the data on the internet to train their models, from this extent, AI invades our data privacy, the creation and use of AI invades us all, the problem will be quite complex if we think so
2. Direct harms caused by AI: the situation may be simpler under this circumstance, still complex though. The problem here would be finding out whether our right is invaded by AI, proving it and figuring out who should be responsible for it(Data provider, AI creator, AI User, The one who benefit from AI)

3.AI is trained by us all, every time we talk with gpt, it will learn from our conversations, trying to make itself more like a human, almost all of us who have employed gpt would become part of its personality, ai is getting new data, training and updating everyday, even the creator of AI may not be able to find out the direct relationship between each data and the outcome of AI.

Group 8. AI Transparency and Explainability

The system's design, data, governance, and processes. It's about openness regarding "what" is in the system and "how" it was made .

The reasoning behind a particular output or prediction. It's about the "why" for an individual case .

The background features a grid of red circles, each enclosed in a thin white square border. These circles are arranged in a pattern that tapers from left to right, with some circles partially cut off by the edges of the frame. In the bottom right corner, there is a large, solid grey triangle pointing towards the left.

Part III – General-purpose AI Obligation in AI Act

General-purpose AI definition in AI Act

The scope of the EU AI Act

- Art. 3(63) '**general-purpose AI model**' means an AI model, including where such an AI model is trained with **a large amount of data** using self-supervision at scale, that displays significant **generality** and is capable of competently performing a wide range of distinct tasks regardless of the way the model is placed on the market and that can be integrated into a variety of downstream systems or applications, **except AI models that are used for research, development or prototyping activities before they are placed on the market**;
- Art. 3(66) '**general-purpose AI system**' means an AI system which is based on a general-purpose AI model and which has the capability to serve a variety of purposes, both for direct use as well as for integration in other AI systems.
- Art. 51 General-purpose AI model with **systemic risks**:
 - it has high impact capabilities evaluated on the basis of appropriate technical tools and methodologies, including indicators and benchmarks;
 - cumulative amount of computation used for its training measured in floating point operations is greater than 10^{25} .

General-purpose AI Obligation in AI Act

The obligations of the GPAI

General-purpose AI Obligations without systemic risks

- Keep up-to-date the technical documentation of the model, including its training and testing process and the results of its evaluation.
 - **General description:** tasks that the model is intended to perform; acceptable use policies; architecture and number of parameters; modality of outputs and inputs; license
 - **Detailed description:** technical means (e.g. instructions of use, infrastructure, tools) required for the general-purpose AI model to be integrated in AI systems; design specifications of the model and training process; data used for training, testing and validation; computational resources used to train the model; known or estimated energy consumption of the model
- Keep up-to-date and make available information and documentation to providers of AI systems who intend to integrate the general-purpose AI model into their AI systems. Without prejudice to the need to observe and protect intellectual property rights and confidential business information or trade secrets
 - Aim: enable providers of AI systems to have a good understanding of the capabilities and limitations of the general-purpose AI model and to comply with their obligations

General-purpose AI Obligation in AI Act

The obligations of the GPAI

- comply with Union law on copyright and related rights;
 - draw up and make publicly available a sufficiently detailed summary about the content used for training of the general-purpose AI model;
- What is the detailed summary of the content used for training?

Article 53(1)d)

Providers of general-purpose AI models must draw up and make **publicly** available a **sufficiently detailed summary** about the content used for training of the GPAI model, according to a **template** provided by the AI Office.

Recital 107

- The summary must be **comprehensive in its scope** rather than technically detailed
- **To facilitate parties with legitimate interests** (including rightholders) **to enforce their rights**, while taking due account of **providers' trade secrets**
- AI Office's **template** should be **simple, effective** and allow the summary in a **narrative form**

General-purpose AI Obligation in AI Act

General-purpose AI Obligation in AI Act

Template for the Public Summary of Training Content for General-Purpose AI models

This template is provided by the European Commission and required to be filled in by providers of general-purpose AI models prior to their placing on the Union market in order to comply with their obligation under Article 53 (1)(d) of Regulation (EU) 2024/1689 (AI Act).

For more information and guidance see Commission's [Explanatory Notice and Template for the Public Summary of Training Content for general-purpose AI models](#) | [Shaping Europe's digital future](#).

Version of the Summary: Version of the summary, with link(s) to previous versions where applicable
Last update: Click or tap to enter a date.

1. General information

1.1. Provider identification

Provider name and contact details: Replace this with your response...

Authorised representative name and contact details: Only applicable if the provider is established outside the Union (see Article 54 AI Act).

1.2. Model identification

Versioned model name(s): Provide the unique identifier(s) for the model(s) or model version(s) covered by this Summary (e.g. Llama 3.1-405B). In accordance with point 30 of the Commission Explanatory Notice to the Template, the same Summary may be used for different model(s) or model version(s) provided the content of their respective Summaries is identical. Where available, provide link(s) to additional publicly available documentation, such as the model card, for the model(s) or model version(s).

Model dependencies: If the model is the result of a modification, including fine-tuning, of one or more general-purpose AI models already placed on the Union market, specify the model (version) name(s) of that/those models and provide a link to their Summary(ies) where available.

Date of placement of the model on the Union market: Indicate the date on which the model was placed on the Union market (including the dates each model (version(s)) was placed on the market, if the Summary applies to more than one model or version (see point 30 of the Commission Explanatory Notice to the Template).

1.3 Modalities, overall training data size and other characteristics

This Section requires general information about the overall training data after pre-processing and before the training of the model.

Modality	Training data size	Types of content
Select the modalities present in the training data, to the extent that they are identifiable	For each selected modality, select the range within which the estimated total training data size for that modality falls. Dynamic datasets may be excluded from the estimation.	For each selected modality, provide a general description of the type of content that has been included in the training data.

☐ Text	☐ Less than 1 billion tokens ☐ 1billion to 10 trillions tokens ☐ More than 10 trillions tokens Alternatively, specify the approximate size in a different measurement unit: <i>Replace this with your response...</i>	<i>Examples of possible types of content include fiction and non fiction text, scientific text, press publications, legal and official documents, social media comments, source code.</i>
☐ Image	☐ Less than 1 million images ☐ 1Million to1 billion images ☐ More than 1 billion images	<i>Examples of possible types of content include photography, visual art works, infographics, social media images, logos, brands.</i>
☐ Audio ¹	☐ Less than 10 000 hours ☐ 10 000 to1 million hours ☐ More than 1 million hours	<i>Examples of possible types of content include musical compositions and recordings, audiobooks, radio shows and podcasts, private audio communication.</i>
☐ Video	☐ Less than 10 000 hours ☐ 10 000 to1 million hours ☐ More than 1 million hours	<i>Examples of possible types of content include music videos, films, TV programmes, performances, video games, video clips, journalistic videos, social media videos.</i>
☐ Other	<i>Specify the modality and for each one indicate approximate size and unit of measurement</i>	

Latest date of data acquisition/collection for model training: Indicate the latest date when data was collected/obtained for the model training: MM/YYYY. Additionally, indicate if the model is continuously trained on new or dynamic data after this date.

Description of the linguistic characteristics of the overall training data: Where applicable, describe the languages covered by the training data (e.g., text, videos or speech), focusing in particular on EU official languages.

Other relevant characteristics of the overall training data: Where such information is readily available and in so far as it is relevant and practicable, describe other relevant characteristics of the overall training data, such as national/regional or demographic specificities of the training data.

Additional comments (optional): Providers may also disclose other relevant information on a voluntary basis (e.g. the compression or tokenization methodologies applied for the data size calculation, the sampling frequency/rate plays for audio or video content).

2. List of data sources

This Section requires information about specific sources of data used to train the general-purpose AI model. In this section "dataset" should be understood as a single, pre-packaged collection of data. The filtering and pre-processing of data collected from the same pre-packaged collection should not be considered a new dataset to be disclosed separately in the sections below. If a particular dataset can be assigned to more than one of the categories below, providers should select the most relevant category and only report the dataset in that category, except in the case of synthetic data (see Section 2.5).

2.1. Publicly available datasets

This Section requires information about datasets that were used to train the model and which have been compiled by a third party, are made available publicly for free, and are readily downloadable as a whole or in predefined chunks, such as datasets and collections available on public repositories and online platforms, specialised websites, or snapshots of common crawl. The public availability of the datasets for free does not

2. List of data sources

This Section requires information about specific sources of data used to train the general-purpose AI model. In this section "dataset" should be understood as a single, pre-packaged collection of data. The filtering and pre-processing of data collected from the same pre-packaged collection should not be considered a new dataset to be disclosed separately in the sections below. If a particular dataset can be assigned to more than one of the categories below, providers should select the most relevant category and only report the dataset in that category, except in the case of synthetic data (see Section 2.5).

2.1. Publicly available datasets

This Section requires information about datasets that were used to train the model and which have been compiled by a third party, are made available publicly for free, and are readily downloadable as a whole or in predefined chunks, such as datasets and collections available on public repositories and online platforms, specialised websites, or snapshots of common crawl. The public availability of the datasets for free does not

¹ Excluding audio that is part of video, as this should be reported under the "video" modality instead. Furthermore, the Commission understands the modality of 'audio' to include 'speech'.

mean that the content at issue is necessarily free of rights since it may be subject to licensing arrangements or conditions of use (e.g., certain free and/or open licenses may determine the scope of the uses, including prohibiting uses relating to model training).

A dataset is considered to be "large" if the total data size for any one of the modalities contained in the dataset exceeds 3% of the size of all publicly available datasets for that modality used for training. The size of the dataset should be based on its size after pre-processing (for example filtering), and without splitting the dataset to prevent reporting circumvention.

Have you used publicly available datasets to train the model? ☐ Yes ☐ No

If yes, specify the modality(ies) of the content covered by the datasets concerned: ☐ Text ☐ Image ☐ Video ☐ Audio

☐ Other *If so, please specify...*

List of **large** publicly available datasets: For each large dataset, provide the identifier/name of the dataset and a link through which the dataset can be accessed. If a link is not available, provide a general description of the dataset, including the approximate start and end dates of the data collection if known (otherwise indicate "not known"). If only part of the datasets has been used for the training, indicate the general approach to selecting those parts.

General description of other publicly available datasets not listed above: For other publicly available datasets that are not listed above, provide a general description of their content. The description could include indication of: (i) the types of modality (e.g. text, images), (ii) nature of the content (e.g. personal data, copyright protected content, machine generated data such as Internet of Things or synthetic data), (iii) its linguistic characteristics, where applicable. (iv) the approximate start and end dates of the data collection if known (otherwise indicate "not known").

Additional comments (optional): Providers may also disclose other relevant information on a voluntary basis, e.g. size of the datasets and other relevant details.

2.2 Private non-publicly available datasets obtained from third parties

This Section requires information about private non-publicly available datasets of third parties that are not publicly available and not disclosed under Section 2.1. These include:

- datasets for which transactional commercial licensing agreements were concluded between the provider and the rightsholders or their representatives, including by collective management organisations and legitimate content aggregators who have the right to collectively license works on behalf of rightsholders (Section 2.2.1);*
- other private datasets obtained through data intermediaries, non-publicly available databases and*

General-purpose AI Obligation in AI Act

The scope of the EU AI Act

- Providers of general-purpose AI models may rely on codes of practice

Limitation and challenges:

- Art. 53: The obligations set out in paragraph 1, points (a) and (b), shall not apply to providers of AI models that are released under a **free and open-source licence** that allows for the access, usage, modification, and distribution of the model, and whose parameters, including the weights, the information on the model architecture, and the information on model usage, are made publicly available;
 - keep up-to-date the technical documentation;
 - keep up-to-date and make available information and documentation to providers;
- This exception shall not apply to general-purpose AI models with systemic risks.
- Prior to placing a general-purpose AI model on the Union market, providers established in third countries shall, by written mandate, appoint an authorised representative which is established in the Union.
 - Open-source model? Because of the open source nature, it would disrupt the understanding of what constitutes “entry into the UK market,” as it would require defining whether merely publishing an open-source AI model online—without actively offering it as a service—qualifies as market entry.

General-purpose AI Obligation in AI Act

The scope of the EU AI Act

General-purpose AI Obligations with systemic risks:

- In addition to Art. 53 & 54, providers of general-purpose AI models with systemic risk shall:
 - perform model evaluation in accordance with *standardised protocols and tools* reflecting the state of the art, including conducting and documenting adversarial testing of the model with a view to identifying and mitigating systemic risks;
 - assess and mitigate possible systemic risks at Union level, including their sources, that may stem from the development, the placing on the market, or the use of general-purpose AI models with systemic risk;
 - keep track of, document, and report, without undue delay, to the AI Office and, as appropriate, to national competent authorities;
 - ensure an adequate level of cybersecurity protection for the general-purpose AI model with systemic risk and the physical infrastructure of the model.
- What are systemic risks?

General-purpose AI Obligation in AI Act

Appendix 1.1 Types of risks

For the purpose of identifying systemic risks pursuant to Measure 2.1, point (1), and Article 3(65) AI Act, the following distinct but in some cases overlapping types of risks apply:

- High capability
 - High impact
 - Large scale
- (1) Risks to public health.
 - (2) Risks to safety.
 - (3) Risks to public security.
 - (4) Risks to fundamental rights.
 - (5) Risks to society as a whole.

Based on these types of risks, a list of specified systemic risks is provided in Appendix 1.4.

As part of the systemic risk identification process that Signatories will conduct, examples of risks falling under the five types of risks above that they will draw upon when compiling the list of risks in Measure 2.1, point (1)(a), are: risks of major accidents; risks to critical sectors or infrastructure, public mental health, freedom of expression and information, non-discrimination, privacy and the protection of personal data, the environment, non-human welfare, economic security, and democratic processes; and risks from concentration of power and illegal, violent, hateful, radicalising, or false content, including risks from child sexual abuse material (CSAM) and non-consensual intimate images (NCII).

General-purpose AI Obligation in AI Act

Appendix 1.4 Specified systemic risks

Based on the types of risks in Appendix 1.1, considering the nature of systemic risks in Appendix 1.2 and the sources of systemic risks in Appendix 1.3, and taking into account international approaches pursuant to Article 56(1) and recital 110 AI Act, the following are treated as specified systemic risks for the purpose of systemic risk identification in Measure 2.1, point (2):

- (1) **Chemical, biological, radiological and nuclear:** Risks from enabling chemical, biological, radiological, and nuclear (CBRN) attacks or accidents. This includes significantly lowering the barriers to entry for malicious actors, or significantly increasing the potential impact achieved, in the design, development, acquisition, release, distribution, and use of related weapons or materials.
- (2) **Loss of control:** Risks from humans losing the ability to reliably direct, modify, or shut down a model. Such risks may emerge from misalignment with human intent or values, self-reasoning, self-replication, self-improvement, deception, resistance to goal modification, power-seeking behaviour, or autonomously creating or improving AI models or AI systems.
- (3) **Cyber offence:** Risks from enabling large-scale sophisticated cyber-attacks, including on critical systems (e.g. critical infrastructure). This includes significantly lowering the barriers to entry for malicious actors, or significantly increasing the potential impact achieved in offensive cyber operations, e.g. through automated vulnerability discovery, exploit generation, operational use, and attack scaling.
- (4) **Harmful manipulation:** Risks from enabling the strategic distortion of human behaviour or beliefs by targeting large populations or high-stakes decision-makers through persuasion, deception, or personalised targeting. This includes significantly enhancing capabilities for persuasion, deception, and personalised targeting, particularly through multi-turn interactions and where individuals are unaware of or cannot reasonably detect such influence. Such capabilities could undermine democratic processes and fundamental rights, including exploitation based on protected characteristics.

AI Obligation in AI Act

AI Obligations:

- **Prohibited AI** (Art. 5): Do not place on the market, put into service, or use
- **High-risk AI systems:**
 - Provider (core compliance package); Conformity assessment (internal control, harmonised standards, notified body, quality management, technical documentation) Risk management system; Data governance and data quality controls; Technical documentation + record keeping/logging; Transparency: instructions for use + user information; Human oversight measures; Accuracy, robustness, cybersecurity; CE marking (before market entry); Post-market monitoring + incident reporting + corrective actions
 - Deployer: Use according to instructions; Human oversight in operation; Monitor performance and keep logs; Data quality; Report serious incidents
 - Importer: Verify compliance basics (CE mark, documentation, instructions); Ensure traceability, cooperate with authorities; Withhold / recall / corrective steps if non-compliance
- **Transparency-only AI systems** (Art. 50): Tell people they are interacting with AI; Label deepfakes or synthetic/manipulated content; Provide notice when emotion recognition or biometric categorisation is used

Questions?

The background features a grid of pink circles, each enclosed in a thin white square border. These circles are arranged in a pattern that tapers from left to right, with some circles partially cut off at the edges. In the bottom right corner, there is a large, solid grey triangle pointing towards the left.

Part IV – The right-based approach to regulate AI

The right-based approach

History:

Human rights law evolved from early legal traditions like the Magna Carta (1215) and Enlightenment ideas on individual freedoms. The American (1776) and French (1789) Revolutions formalized rights in national laws. After World War II, atrocities led to the Universal Declaration of Human Rights (1948) and later treaties like the ICCPR (1966). In Europe, the European Convention on Human Rights (1950) and the EU Charter of Fundamental Rights (2000) established regional human rights protections.

1. Rights to privacy and data protection

Article 7

Respect for private and family life

Everyone has the right to respect for his or her private and family life, home and communications.

Article 8

Protection of personal data

1. Everyone has the right to the protection of personal data concerning him or her.
2. Such data must be processed fairly for specified purposes and on the basis of the consent of the person concerned or some other legitimate basis laid down by law. Everyone has the right of access to data which has been collected concerning him or her, and the right to have it rectified.
3. Compliance with these rules shall be subject to control by an independent authority.

The right-based approach

➤ **Blurring the Line Between Intrusion and Public Information**

- GenAI models, trained on massive datasets scraped from the web, often process publicly available yet personal data (e.g., social media posts, forum discussions).
- Unlike traditional intrusion (e.g., hacking), AI doesn't "break in" but still extracts and repurposes personal data in ways users didn't anticipate, challenging the distinction between public and private spheres.

➤ **Expanding the Concept of “Disclosure of Private Facts”**

- AI models can infer and generate personal information about individuals beyond what was originally disclosed (e.g., reconstructing private data from online fragments).
- AI-powered doxxing, where models aggregate and expose personal details, creates new privacy threats not explicitly covered by Prosser's disclosure category.

➤ **The New “False Light”: Hallucinated Identities**

- AI enables realistic deepfakes, using a person's likeness, voice, and even personality without consent.
- Unlike Prosser's focus on commercial misappropriation (e.g., unauthorized endorsements), AI-generated personas can be used for impersonation, fraud, or political manipulation, expanding the legal and ethical concerns.

➤ **Beyond Traditional Appropriation: Deepfakes & Synthetic Identity**

- Unlike Prosser's focus on commercial misappropriation (e.g., unauthorized endorsements), AI-generated personas can be used for impersonation, fraud, or political manipulation, expanding the legal and ethical concerns.

The right-based approach

➤ **AI anthropomorphism vs. Foundation of Data Protection Law**

- Informational self-determination & Digital Autonomy
- Relational Trust in AI

➤ **Challenges:**

- Power asymmetry
- Consent vs. Self-disclosure
- Data Minimization vs. context collapse
- Purpose Limitation vs. Model improvement
- Data Security
- Inference harms vs. privacy leakage
- Memory illusion vs. Right to be forgotten
- Exercise Data Protection Rights??

The right-based approach

➤ Accuracy Principle vs. Hallucination – Accuracy Paradox

- Accuracy optimisation can reward surface plausibility, rhetorical fluency, and benchmark performance, even when outputs remain epistemically fragile in real interaction.
- Not Inaccurate: Many harmful outputs are not straightforwardly false: they can be unfalsifiable, value-laden, selectively framed, or socially distorting. Accuracy-as-disguise: key risk is that “technically plausible” or “not inaccurate” responses can still steer beliefs and behavior
- Too Accurate Society: Oversimplify, convergence and loss of plurality; Collective deskilling and democratic fragility

➤ Regulatory diagnosis:

- AI Act: treats accuracy as a marker of trustworthiness but applies it narrowly (notably through high-risk framing)
- On manipulation: the AI Act’s prohibition is framed around intent, subliminal techniques, and significant harm, which can miss emergent, interaction-driven persuasion where outputs are fluent and factually plausible but still epistemically misleading
- GDPR Article 5(1)(d) and the right to rectification (Article 16) are designed around deterministic, record-based personal data that can be located, corrected, and neutralised.
- For probabilistic, non-repeatable LLM outputs, what counts as “inaccuracy” is often ambiguous, and harms may arise even when outputs are not verifiably false, making the accuracy principle a weak fit on its own.

The right-based approach

2. Freedom of expression and information

Article 11—Charter

Freedom of expression and information

1. Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers.
2. The freedom and pluralism of the media shall be respected.

➤ Individual speech rights:

➤ Truth vs. Free Expression in AI-Generated Content

- No Legal Duty to Tell the Truth: Individuals have broad speech protections, even when making false statements, unless they cause harm (e.g., defamation).
- AI's Role as an "Artificial Speaker": Unlike humans, GenAI does not have intent or subjective belief, yet its outputs can still spread misinformation. This challenges traditional legal frameworks that assume a human speaker.

➤ Rights to search and access:

- The Shift from Human Search to AI-Generated Summaries
- The Role of AI as an "Intermediary" with Limited Truth Obligations
- Risk of Information Distortion and Bias in AI-Generated Search

The right-based approach

2. Freedom of expression and information

➤ Free press and journalism:

- The freedom of the press and journalism, protected under Article 11(2) of the EU Charter of Fundamental Rights, guarantees media pluralism and the press's role as a public watchdog.
 - Does AI count as journalism? The European Court of Justice (ECJ) has broadly interpreted journalism to include individuals sharing public-interest information, even if they are not professional journalists.
 - LLMs as information intermediaries: If AI-generated content is widely used for news summaries or analysis, should AI providers be treated like news publishers? This would imply responsibilities for accuracy, impartiality, and reliability—standards currently applied to traditional media
 - Lack of accountability: Traditional journalism follows standards of fact-checking and ethical reporting, while GenAI may hallucinate facts or amplify biases without human oversight.
 - Regulatory Gaps: Many Member States require journalists to produce truthful content, but AI models lack direct liability—raising questions about who is responsible when AI spreads false information.

The right-based approach

3. Freedom of science and academia

- The freedom of science and academia, protected under Article 13 of the EU Charter of Fundamental Rights, ensures researchers and institutions can conduct independent research without interference.
 - The European Court of Justice (ECJ) recognizes both individual researchers and research institutions as rights holders under Article 13. However, it remains unclear whether GenAI providers fall under this protection—should AI-generated research be treated the same as human-led research?
 - UNESCO recommendations and the European Charter for Researchers impose an obligation on scientists to seek knowledge with honesty and integrity.
 - However, GenAI models may generate misleading or incorrect research outputs, which could distort academic discourse.
 - The lack of transparency in AI training data raises concerns about biases in AI-assisted research.
- AI as a Research Tool vs. a Knowledge Gatekeeper?
 - AI-driven archives and search engines are increasingly used for scientific discovery and literature reviews;
 - If AI-generated results prioritize or exclude certain sources, this could lead to knowledge homogenization and suppression of dissenting academic viewpoints;
 - There is no clear legal framework ensuring AI-generated research findings adhere to academic integrity standards.

The right-based approach

5. Economic rights related to work, conducting a business and property

- The right to work, conduct a business, and own property, protected under Articles 15, 16, and 17 of the EU Charter of Fundamental Rights, ensures economic freedoms.
 - **Freedom to Choose an Occupation and Right to Work (Article 15)**
 - GenAI disrupts traditional job markets: Automation, AI-generated content, and machine learning replace human roles in areas like journalism, content creation, and legal research.
 - Legal uncertainty for AI developers: Should AI developers have a duty to ensure truthfulness in AI-generated content? So far, no legal precedent extends Article 15 protections to software engineers or AI firms
 - **Freedom to Conduct a Business (Article 16)**
 - Good for AI companies?
 - AI-driven businesses face regulatory scrutiny: While businesses generally enjoy freedom from excessive state interference, the ECJ has ruled that economic freedoms can be restricted in the public interest, such as in cases of consumer protection, public health, and financial stability
 - Duty to provide truthful AI outputs?
 - **Right to Property, Including Intellectual Property (Article 17)**
 - AI and ownership of generated content

Questions?

Part V – Group Activity

Group Discussion

Please discuss how should we deal with the challenges raised by Open-Source Generative AI?

1. Identify which category they are in AI Act?
2. Identify what kind of obligations they have?
3. Analyse what kind of challenges they might pose to the current EU approach?
4. Potential solutions?

THANK YOU!

Office hour: Mondays, 2:00-3:00pm.
